Chapter 1: Probability, Percent, Rational Number Equivalence (3-4 weeks)

UTAH CORE Standard(s)

Number Sense:
1. Convert a rational number to a decimal using long division; know that the decimal form of a rational number terminates in 0s or eventually repeats. 7.NS.2d

2. Solve real-world and mathematical problems involving the four operations with rational numbers. 7.NS.3

Probability and Statistics:
1. Understand that the probability of a chance event is a number between 0 and 1 that expresses the likelihood of the event occurring. Larger numbers indicate greater likelihood. A probability near 0 indicates an unlikely event, a probability around ½ indicates an event that is neither unlikely nor likely, and a probability near 1 indicates a likely event. 7.SP.5

2. Approximate the probability of a chance event by collecting data on the chance process that produces it and observing its long-run relative frequency, and predict the approximate relative frequency given the probability. For example, when rolling a number cube 600 times, predict that a 3 or 6 would be rolled roughly 200 times, but probably not exactly 200 times. 7.SP.6

Equations and Expressions:
1. Solve multi-step real-life and mathematical problems posed with positive and negative rational numbers in any form (whole numbers, fractions, and decimals), using tools strategically. Apply properties of operations to calculate with numbers in any form; convert between forms as appropriate; and assess the reasonableness of answers using mental computation and estimation strategies. For example: If a woman making $25 an hour gets a 10% raise, she will make an additional 1/10 of her salary an hour, or $2.50, for a new salary of $27.50. If you want to place a towel bar 9 3/4 inches long in the center of a door that is 27 1/2 inches wide, you will need to place the bar about 9 inches from each edge; this estimate can be used as a check on the exact computation. 7.EE.3

Chapter 1 Summary:
Chapter 1 begins with a brief introduction to probability as a means of reviewing and applying arithmetic with whole numbers and fractions. In addition to covering basic counting techniques and listing outcomes in a sample space, students distinguish theoretical probabilities from experimental approaches to estimate probabilities. One reason for starting the year with probability activities is to develop a culture of thinking about mathematics as a way to investigate real world situations. A second reason is that activities at the beginning of the year can help foster a classroom culture of discussion and collaboration.

Throughout the chapter students are provided with opportunities to review and build fluency with fractions, percents, and decimals from previous grades. Students should understand that fractions, percents and decimals are all relative to a whole. Students will also compare and order fractions (both positive and negative.) This chapter concludes with a section specifically about solving percent and fraction problems, including those involving discounts, interest, taxes, tips, and percent increase or decrease.
**VOCABULARY:** chance, decimal, experimental probability, fraction, frequency, outcome, percent, probability, ratio, theoretical probability

**CONNECTIONS TO CONTENT:**

**Prior Knowledge**
In previous coursework, students developed the concept of a ratio. Though students should be familiar with the idea of part:whole and part:part relationships, they have likely not completely solidified it yet. It is important to emphasize that in this chapter only part:whole relationships are discussed (probability is a part:whole relationship as are fractions, decimals and percents.) In Chapter 4 students will practice differentiating between part:part and part:whole relationships and then examine “odds” which are part:part relationships.

Students have used all four operations (addition, subtraction, multiplication, and division) when working with fractions and decimals in prior grades. They should have used both number line and bar/tape models to represent fractions, percents, and decimals.

In 6th grade students placed both positive and negative numbers on a number line, however they do not operate with negative numbers until 7th grade (this will take place in Chapter 2).

**Future Knowledge**
As students move through this chapter, they will begin by studying probability (this chapter is only an introduction to probability, students will work more with probability in Chapter 7). The concepts learned in 7th grade regarding chance processes as well as theoretical and experimental probabilities will be extended in later courses when students study conditional probability, compound events, evaluate outcomes of decisions, use probabilities to make fair decisions, etc.

While studying probability students will continue their study of rational numbers. They will convert rational numbers to decimals and percents and will look at their placement on the number line. This lays the foundation for 8th grade where students study irrational numbers to complete the Real Number system.

Another important concept that will be extended is the notion of “unit.” Throughout the year students will: a) clearly distinguish between kinds of units (e.g. linear, square or cubic) and b) consider units of quantities. For example a “unit” of consideration might be a distance of 5 miles as in walking 5 miles per hour. So, if they want to know how far one walks in 20 minutes, 1/3 of an hour, then one simply divides the 5 mile unit into 3 parts. Thus in 20 minutes one has walked 5/3 miles.
### MATHEMATICAL PRACTICE STANDARDS (emphasized):

<table>
<thead>
<tr>
<th>Practice Standard</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Make sense of problems and persevere in solving them</td>
<td>Students explain and demonstrate rational number operations by using symbols, models, words, and real life contexts. Students demonstrate perseverance while using a variety of strategies (number lines, manipulatives, drawings, etc.). Students make sense of probability situations by creating visual models to represent situations.</td>
</tr>
<tr>
<td>Reason abstractly and quantitatively</td>
<td>Students connect ideas of models to ideas of numbers. For example, students should reason that one can partition a whole into any number $n$ equal pieces and then represent a portion of the whole as $m/n$. The number $m/n$ can then be located on the real line.</td>
</tr>
<tr>
<td>Construct viable arguments and critique the reasoning of others</td>
<td>Students construct arguments using verbal or written explanations accompanied by expressions, equations, inequalities, or models. Students discuss rules for operations with rational numbers using appropriate terminology and tools/visuals. Students approximate probabilities, create probability models and explain reasoning for their approximations. They also question each other about the representations they create to represent probabilities.</td>
</tr>
<tr>
<td>Model with mathematics</td>
<td>Students model understanding of rational number operations using tools such as tiles, counters, visuals, tape/bar models, and number lines and connect these models to solve problems involving real-world situations. Students model problem situations symbolically, graphically, and contextually. Students use experiments or simulations to create probability models.</td>
</tr>
<tr>
<td>Attend to precision</td>
<td>Students should use appropriate terminology when referring to ratios, probability models, rational numbers, and equations. Students also use appropriate forms of a number to fit a context, e.g. one would not say $3/2$, rather they would say $1.50$.</td>
</tr>
<tr>
<td>Look for and make use of structure</td>
<td>Students look for structure in rational numbers when they place them appropriately on the number line. Students should connect the structure of fractions, percents, and decimals to the idea of part:whole relationships to missing finding values (e.g. students should use structure, not algorithms, to solve problems). Students recognize that probability can be represented in tables, visual models, or as a rational number.</td>
</tr>
<tr>
<td>Use appropriate tools strategically</td>
<td>Students demonstrate their ability to select and use the most appropriate tool (paper/pencil, manipulatives, pictorial models, and calculators) while solving problems with rational numbers. Students might use physical objects or applets to generate probability.</td>
</tr>
<tr>
<td>Look for and express regularity in repeated reasoning</td>
<td>Students use repeated reasoning to understand algorithms and make generalizations about patterns. They extend their thinking to include complex fractions and rational numbers. They create, explain, evaluate, and modify probability models to describe simple events.</td>
</tr>
</tbody>
</table>
1.0 Anchor Problem: Percent Estimation Game

Below are two vertical lines on which you will make a guess for both a number and a percent.

Estimate the numeric location of the point on the vertical line on the right. __________

Estimate its equivalent percent of 80 using the line on the left.

___________

Student answers will vary. The point is located at approximately 60 (the point is about ¾ of the way up the line on the right.) Ask students to justify their answers. Let them know that there is no absolute right answer, they’re just estimating. The corresponding point on the vertical line on the left should be at the same height e.g. about ¾ of the way up. Have them guess where they think it is on that line—it’s at approximately 75%. Don’t find the exact percent yet. Your goal is to help students develop an intuitive sense of percentages. You want students to talk about portions of each whole. For example a student might say, “the point is about ¾ of the way up on 80, so the percent is about ¾ of 100, so it’s about 75%.”

2) You and five of your friends like to go to McDonalds once a week and get Happy Meals for the prize inside. McDonalds has just started a new “dinosaur toy” promotion for their Happy Meals with six different dinosaurs you can collect: Brachiosaurus, Brontosaurus, Diplodocus, Tyrannosaurus, Plesiosaurus, and Allosaurus. You each want to collect at least one of all six dinosaurs, but the prizes are randomly placed in Happy Meals, and there is no way to know which dinosaur you’re getting until you open the Happy Meal bag.

How might you design a simulation experiment to find the likelihood (experimental probability) of getting all six toys after one, two, three, etc. weeks?

Section Overview:
This is students’ first formal introduction to probability. In this section students will study chance processes, which concern experiments or situations where they know which outcomes are possible, but they do not know precisely which outcome will occur at a given time. They will look at probabilities as part:whole ratios expressed as fractions, decimals, or percents. Probabilities will be determined by considering the results or outcomes of experiments. Students will learn that the set of all possible outcomes for an experiment is a sample space. They will recognize that the probability of any single event can be expressed in terms of impossible, unlikely, equally likely, likely, or certain or as a number between 0 and 1, inclusive. Students will focus on two concepts in probability of an event: experimental and theoretical. They will understand the commonalities and differences between experimental and theoretical probability in given situations.

Concepts and Skills to be Mastered (from standards)
1. Understand and apply likelihood of a chance event as between 0 and 1.
2. Approximate probability by collecting data on a chance process (experimental probability).
3. Calculate theoretical probabilities on a chance process for simple events.
4. Given the probabilities (different scenarios in a chance process), predict the approximate frequencies for those scenarios (if experimenting on a chance process).
5. Use appropriate fractions, decimals and percents to express the probabilities.

TEACHER NOTES for Activity 1.1a:

Materials: (Note: If you do not have tiles you can use pieces of square paper or other objects that are different colors but the same shape and size. All bags should have 12 items.)
- 2 bags with 2 green tiles and 10 blue tiles
- 2 bags with 4 green tiles and 8 blue tiles
- 2 bags with 6 green tiles and 6 blue tiles
- 2 bags with 8 green tiles and 4 blue tiles
- 2 bags with 10 green tiles and 2 blue tiles
- Calculators

The primary objective of this lesson is to develop the idea of theoretical v. experimental probability. However, an important secondary objective is to review the concept that a fraction is relative to a whole.

During this activity students will use probability to try to determine the number of green tiles in a bag.
Tell students: “I am giving each group a bag of tiles. Each bag has exactly 12 tiles—some green and some blue. Each group has a different number of green and blue tiles in their bags. Without looking in the bag, you’re going to pull out a tile and record the color and put the tile back into the bag. You’re going to do that a certain number of times as indicated on the activity paper. Then based on the outcomes of your draws, you’re going to try to figure out how many of the tiles in your bag are green and blue. Do NOT look in your bag until I tell you to!”

Discussion Ideas:
- During the activity have students discuss the difference between theoretical probability and experimental probability. Have students discuss the similarities and difference between the results of each group. Discuss which outcome is the most likely and least likely to occur.
- After the groups have counted the actual number of tiles in their bags, discuss (either as a group or in smaller groups) how experimental probabilities were the same and different for groups with the same number of green and blue tiles and for those with different numbers.
REVIEW FROM EARLIER GRADES:

1. Use a bar model to represent 3/4 of a whole.

2. Use a bar model to represent 3/5 of a whole.

3. Use a bar model to represent 3/10 of a whole.

4. What do you notice about the fractions in #1-3?
   The numerators of the fractions are all the same, so we are always taking 3 of the portions. As the denominator increases so do the number of equal sized pieces in our whole, so the size of our 3 sections is getting smaller with each fraction. (i.e. As the denominator increases the size of the fraction decreases.)
1.1a Class Activity: Using Data to Make Predictions (Probability)

1. In your own words, what do you think these terms mean?
   “Experimental” probability: ____________________________
   “Theoretical” probability: ____________________________

HOW MANY GREEN TILES ARE IN YOUR BAG?
We will examine experimental and theoretical probability in this activity. You have been given a bag with a total of 12 tiles, some are green and the rest are blue. You will do the experiment described below 6, 12, 18, 24 and then 30 times to try to figure out how many green tiles are in your bag. DO NOT LOOK IN YOUR BAG! Each group has a different number of green tiles in their bag.

Instructions: a) without looking in the bag, draw ONE tile record the color (G or B) in the table, b) put the tile back into the bag and shake it to mix up the tiles, c) repeat the indicated number of trials (notice that there are a – e experiments), d) based on each experiment guess how many GREEN tiles are in the bag.

2. a. Draw a marble/tile (without looking in the bag), record the color, replace it, mix them by shaking, redraw, record, replace. Do this 6 times.

<td></td>
</tr>
</tbody>
</table>

Based on your experiment, how many of the 30 draws were GREEN? ________
Based on these 30 draws, how many of the 12 marbles/tiles in the bag do you think are green? _____
Probability has standard notation. We write $P(G)$ to means the probability of drawing a green tile. To write $P(G)$ we need to know the “observed frequency” and the “total number of trials.” Probability is the ratio of the observed frequency to the total number of trials:

$$P(G) = \frac{\text{observed frequency}}{\text{total number of trials}}$$

Note: probability is a part:whole relationship.

Write your group’s $P(G)$ as both a fraction and decimal for each of the experiments you did on the previous page.

a. $P(G) =$ _________ _________

b. $P(G) =$ _________ _________

c. $P(G) =$ _________ _________

d. $P(G) =$ _________ _________

e. $P(G) =$ _________ _________

3. Make a graph of your group’s samplings.

Most likely graphs will “flatten out” as the number of trials in an experiment increases. Ask students why this might be happening.
4. Explain what your graph shows about the probability of GREEN tiles.
   Experimental probability can vary for a group even though the number of tiles does not. *different experimental probabilities may tell us something about the actual number of tiles in the bags *probability is always between 0 and 1

5. Explain why your probability of GREEN tiles is a fraction (between 0 and 1).
   Probability is the ratio between observed frequency and total trials—observed frequency can never be smaller than 0 or bigger than total trials.

6. How does knowing the probability of GREEN tiles help you know the probability of BLUE tiles?
   The total outcome will be 1. Thus if the probability of GREEN is 1/3, the probability of BLUE must be 2/3.

7. Make a conjecture about how many GREEN tiles are in your bag if the bag contains 12 total tiles.
   Have all groups record their predictions.

8. Count how many blue and green marbles/tiles are actually in your bag. Based on this information, what is the “theoretical” probability of drawing a green tile from your bag?

9. How did your group’s “experimental” $P(G)$ compare with the “theoretical” $P(G)$?
   It is likely that the more trials in the experiment, the closer the experimental probability came to the theoretical probability.

10. In your own words, what do you think:
    - “Experimental” probability means?
    - “Theoretical” probability means?
11. Place the theoretical probability of drawing a green for each group in the class on the number line below.

Do this as a class and discuss what students see.

12. Which groups are most and least likely to have an outcome of drawing a green out of the bag? Justify your answer.

Have students justify their arguments. Ask them for evidence to support their claims.

As groups discuss:

13. Suppose you had a bag of 1000 blue and green tiles, how many times do you think you would need to draw tiles to make an accurate prediction of the number of blue and green tiles are actually in the bag? Explain.

Note: students are making a conjecture here. The important word is “accurate.” We cannot be 100% sure that our guess is correct. The “mathematical” answer would be something like: after n number of draws, with p% probability we are within q% of the correct amount.

14. You’re a teacher in a 7th grade math class and you want to create an experiment for your class with red, yellow and purple marbles in a bag. You want the theoretical probability of drawing a red marble to be \( \frac{1}{4} \), the theoretical probability of drawing a yellow to be \( \frac{1}{4} \) and the theoretical probability of drawing a purple to also be \( \frac{1}{2} \). If you want a total of 120 marbles in the bag:

a. How many red marbles should you put in the bag? _____30_____
b. How many yellow marbles should you put in the bag? _____30_____c. How many purple marbles should you put in the bag? _____60_____

Review exercises:

15. Without using a calculator, determine which fraction is larger. Justify your answer with an explanation and model.

<table>
<thead>
<tr>
<th>a.  ( \frac{1}{8} )</th>
<th>b.  ( \frac{7}{8} )</th>
<th>c.  ( \frac{8}{15} )</th>
<th>d.  ( \frac{9}{21} )</th>
</tr>
</thead>
<tbody>
<tr>
<td>( \frac{1}{9} )</td>
<td>( \frac{8}{9} )</td>
<td>( \frac{8}{17} )</td>
<td>( \frac{13}{22} )</td>
</tr>
</tbody>
</table>

There are a number of ways to determine which fraction is larger. Ask students to share their thinking. a. \( \frac{1}{8} \): 8th are larger than 9th; if you cut something up into 8 pieces each piece will be larger than if you cut the whole into 9 pieces. b. \( \frac{8}{9} \). The same logic for “b” except now you’re removing either an 8th or a 9th, removing a smaller portion of the whole leaves you with a bigger result. c. \( \frac{8}{15} \) is larger because it’s a little more than \( \frac{1}{2} \), while \( \frac{8}{17} \) is a little less. OR one might argue that for both fractions we’re talking about 8 pieces. For 8/15 we have eight pieces that are 1/15 but for 8/17 we have the same number of pieces, but they are 1/17 of the whole. 1/15>1/17, therefore 8/15>8/17. d. \( \frac{9}{21} < \frac{13}{22} \).
1.1a Homework: Probability Predictions

1. You flipped a coin 50 times and got 23 heads. What is the experimental probability of getting a head? Write your answer as a fraction, decimal and percent.

\[
\frac{23}{50} = 0.46 = 46\%
\]

2. If you flipped the coin 100 times, how many heads would you expect to get? Explain your answer.
   Answers will vary a little. They may say 46 times since \(50(2) = 100\) so multiply 23 by 2. Or they may say 50 times since they would expect to get a head about \(\frac{1}{2}\) of the time.

3. A coin is tossed 20 times. It lands on heads 9 times. What is P(H) according to your experiment? Write your answer as a fraction, decimal and percent.

4. You’re a teacher in a 7th grade math class and you want to create an experiment for your class with red, yellow and purple marbles in a bag. You want the theoretical probability of drawing a red marble to be \(\frac{1}{2}\), the theoretical probability of drawing a yellow to be \(\frac{1}{3}\) and the theoretical probability of drawing a purple to also be \(\frac{1}{6}\). If you want a total of 1260 marbles in the bag:
   a. How many red marbles are you going to put in the bag? Why?
   
   b. How many yellow marbles are you going to put in the bag? Why?
   420 yellow marbles, that is \(1/3\) the total in the bag.
   c. How many purple marbles are you going to put in the bag? Why?

4. Challenge: You’ve decided you want to make the marble experiment a little more difficult. You want to use 400 marbles and you want six different colors—blue, red, green, yellow, purple, and pink. You also do not want more than two colors to have the same probability. State the number of each color you are going to put in the bag and what the theoretical probability of drawing the color will be (answers will vary.)

(Answers will vary.) Here is one possibility.

a. Blue: \(P(B)\) \(\frac{1}{2}\) and actual number of blue _____ 200 _____

b. Red: \(P(R)\) _____ and actual number of red _____ 100 _____

c. Green: \(P(G)\) \(\frac{1}{8}\) and actual number of green __________

d. Yellow: \(P(Y)\) _____ and actual number of yellow ____ 4 ______

e. Purple: \(P(Purple)\) \(\frac{1}{10}\) and actual number of purple __________

f. Pink: \(P(Pink)\) _____ and actual number of pink ____ 6 ____

What should the sum of all the probabilities be? They should sum to 1.
Answer the following:

5. Without using a calculator, determine which fraction is bigger in each pair. Justify your answer with picture and words.
   a. \( \frac{1}{3} \) or \( \frac{1}{2} \)
   b. \( \frac{3}{7} \) or \( \frac{3}{5} \)

6. Place the fractions on the number line below.

   1 piece out of a pie cut into 2 will be bigger than 1 piece out of a pie cut into 3 pieces

7. Order the following fractions from least to greatest.

   1 piece out of a pie cut into 2 will be bigger than 1 piece out of a pie cut into 3 pieces

Spiral Review

1. Use a bar model to represent \( \frac{3}{4} \) of a whole.

2. Solve using bar model \( \frac{1}{2} + \frac{3}{7} = \) _______
1.1b Class Activity: Probability—Race to the Top

1. For the horse race experiment you will need two dice. For each roll of the dice record the sum in the appropriate column below by shading in the box. For example, a roll of 2,5 means you will shade one box in the 7 column, a roll of 1,4 means you will shade one box in the 5 column. Do this 30 times. **BEFORE you start, predict which horse will win (2 through 12).**

<table>
<thead>
<tr>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
<th>7</th>
<th>8</th>
<th>9</th>
<th>10</th>
<th>11</th>
<th>12</th>
</tr>
</thead>
</table>

2. Which horse won (had the most rolls) in your group? _____

3. List your group’s experimental probability for each outcome:
   a. \( P(2) \) _______
   b. \( P(3) \) _______
   c. \( P(4) \) _______
   d. \( P(5) \) _______
   e. \( P(6) \) _______
   f. \( P(7) \) _______
   g. \( P(8) \) _______
   h. \( P(9) \) _______
   i. \( P(10) \) _______
   j. \( P(11) \) _______
   k. \( P(12) \) _______

4. List the horse that won for each of the groups in your class. Which horse won the most often?
   Have each group report which horse won in their experiment. Circle the horse that won the most times.

5. Create a class histogram that combines the data from all of the groups’ histograms. What do you notice about the histogram? **The class histogram should include the outcomes for all the groups.**
6. Which horse won the most often for all the groups? Why?

Have students justify their arguments. Ask them for evidence to support their claims.

7. Do you think that this game is fair? Why or why not?

Note: you are developing the idea of “fair” in a game. The term will be formalized in Chapter 7.

8. What are all the possible outcomes when you roll two dice? In your group, organize these possible outcomes on a chart of your choosing. See examples below. Students will try a number of techniques, look for students that use a systematic one to share with the class. This is a good time to talk about “equally likely” outcomes; e.g. a roll with a sum of 3 and a rolled sum of 11 are equally likely. Talk about why this is true.

</table>

Notice that the dice shown below are different colors, this is to help students distinguish between 6, 1 and 1,6. These are two different outcomes.

9. How many total outcomes did you get? Explain the system you used to get all those outcomes. 36 possible outcomes; have students present their strategies. Look for systematic approaches to highlight.

10. Use the above information to determine the probability for each outcome:

\[ P(1) = \frac{0}{36} \]

Discuss the "likelihood of events with students e.g. a roll of 1 with two die is impossible. A roll of a 7 is more likely than a roll of either a 6 or 8. A roll of 6 or 8 are equally likely, etc.

\[ P(7) = \frac{6}{36} = \frac{1}{6} \]

\[ P(2) = \frac{1}{36} \]

\[ P(8) = \frac{5}{36} \]

\[ P(3) = \frac{2}{36} = \frac{1}{18} \]

\[ P(9) = \frac{4}{36} = \frac{1}{9} \]

\[ P(4) = \frac{3}{36} = \frac{1}{12} \]

\[ P(10) = \frac{3}{36} = \frac{1}{12} \]

\[ P(5) = \frac{4}{36} = \frac{1}{9} \]

\[ P(11) = \frac{2}{36} = \frac{1}{18} \]

\[ P(6) = \frac{5}{36} \]

\[ P(12) = \frac{1}{36} \]

11. How do you think the individual probabilities relate to the probabilities of the sums? For example, \[ P(1, 6) = \frac{1}{36} \] but \[ P(7) = \frac{1}{6} \], why is this true?

Students should recognize that there are 6 ways to roll a 7, but only one way to roll a 1,6. Discuss how 1,6 is a different outcome from 6,1.
1.1b Homework: Probability

Write all probabilities as a fraction, decimal and percent.

1. Find all the possible outcomes of flipping a coin (heads or tails) FOUR times. In other words, how many different ways are there to get heads and/or tails in four flips?

Toss #1

Toss #2

Toss #3

Toss #4

Encourage students to use whatever model they choose to compute. Below is an example of a tree diagram that shows 16 possible outcomes. Have students display their models to the class and explain how they systematically ensured they found all possible outcomes. Connect the outcomes from the model to the idea of “theoretical probability.”

2. Based on #1, what is the theoretical probability that you:

a. Get HEADS for all four flips?
   \[ \frac{1}{16} = 0.0625 = 6.25\% \]. There is only one strand on the tree diagram that shows HHHH.

b. Get HEADS at least once in four flips?
   \[ \frac{15}{16} = 0.9375 = 93.75\% \]. There are 15 strands on the tree diagram that contain an H.

c. Get HEADS exactly three times in four flips?
   \[ \frac{4}{16} = \frac{1}{4} = 0.25 = 25\% \]. There are only 4 strands that contain three heads(HHH) exactly three times.

3. Without using a calculator, determine which fraction is bigger in each pair. Justify your answer.

a. \( \frac{3}{7} \) or \( \frac{3}{8} \)
   For each we have 3 parts of a whole that was cut into either 7 or 8. 1/7 is larger than 1/8, so 3 groups of 1/7 is more than three groups of 1/8.

b. \( \frac{7}{13} \) or \( \frac{9}{20} \)
4. Place the fractions on the number line below.

\[
\frac{6}{5}, \frac{3}{10}, \frac{1}{5}, \frac{3}{2}
\]

5. Order the following fractions from least to greatest.

\[
\frac{6}{5}, \frac{3}{10}, \frac{1}{5}, \frac{3}{2}
\]

Spiral Review

1. Write \( \frac{1}{3} \) as a percent. \( 33\frac{1}{3}\% \)

2. What is the area of the following figure?

\[
\text{4 in.} \quad \text{28 in. sq.}
\]

3. Write one fourth as a fraction, decimal, and percent. \( \frac{1}{4} = 0.25 = 25\% \)
1.1c Class Activity: Probability Continued and Fair Game?

Use the data from problem 1 on Homework 1.1.b to answer the following:

1. What is the probability of getting exactly one HEAD on the first flip? _____ $\frac{1}{2}$ _______

2. What is the probability of getting one HEAD on the first and second flips? _____ $\frac{1}{4}$ _______

3. What is the probability of getting one HEAD on the first, second and third flips? _____ $\frac{1}{8}$ _______

4. What is the probability of getting one HEAD on all four flips? _____ $\frac{1}{16}$ _______

5. What pattern do you see emerging? ▶
   Possible answers:
   - The denominator doubles each time. Be clear that doubling the denominator does NOT mean doubling the fraction.
   - You multiply by $\frac{1}{2}$ each time.

6. After two flips of the coin, what is the probability of getting at least one HEAD? _____ $\frac{3}{4}$ _______

7. After three flips of the coin, what is the probability of getting at least one HEAD? _____ $\frac{7}{8}$ _______

8. After four flips of the coin, what is the probability of getting at least one HEAD? _____ $\frac{15}{16}$ _______

9. What do you notice about the probabilities in questions 6-8? ▮▮
   Students should notice that the probability of getting at least one HEAD is always $1 - \frac{1}{n}$ .

10. Explain why the numerator is always one less than the denominator when finding the probability for at least one HEAD. ▲▲
Fair Games:

Games 1 and 2: Use two dice OR an electronic random number generator on a calculator (on the TI-73 go to Math, PRB, dice, enter, type in 2 for two dice, then hit enter to roll the dice.) Play the game in pairs. One person will be “even” the other will be “odd”. For the “Addition Game” the “even” person earns a point if the sum of the two dice is even and the “odd” person earns a point if the sum is odd. For the “Multiplication Game” the “even” person gets a point if the product of the dice is even and the “odd” person gets a point if the product is odd.

Game 1: The Addition Game

1. Do you think the Addition Game will be fair—do “odd” and “even” have the same chance at winning? Explain.

2. Play the game—36 rolls of the dice. Based on your data, what is the experimental probability of rolling an odd sum? Probability of rolling an even sum?
   \[ P(\text{odd}) = \quad P(\text{even}) = \]

3. Look back at the data you gathered from the probability experiment in 1.1b Class Activity (Race to the Top game). What was the theoretical probability of rolling an odd sum or even sum from that data?
   \[ P(\text{odd}) = \; \frac{1}{2} \; P(\text{even}) = \; \frac{1}{2} \]
   \[ P(\text{odd}) \; \text{and} \; P(\text{even}) \; \text{are equally likely.} \]

4. Do you think the addition game is a fair game? Explain.
   This is a fair game, because there is an equal likelihood of rolling an even sum or an odd sum.

Game 2: The Multiplication Game

1. Do you think the multiplication game will be fair—do “odd” and “even” have the same chance at winning? Explain.

2. Play the game—36 rolls of the dice. Based on your data, what is the experimental probability of rolling an odd product? Probability of rolling an even product?
   \[ P(\text{odd}) = \quad P(\text{even}) = \; \frac{27}{36} = \; \frac{3}{4} \]

3. How will the sample space for the multiplication game be the same and/or different from the addition game?
   One could use the same sample space as created in 1.1b Class Activity, but would need to analyze it differently to account for the products.

4. Find the theoretical probability of rolling an odd product and even product?
   Discuss with students the P(even) is more likely that P(odd).
   \[ P(\text{odd}) = \; \frac{9}{36} = \; \frac{1}{4} \quad P(\text{even}) = \; \frac{27}{36} = \; \frac{3}{4} \]

5. Do you think the multiplication game is a fair game? Explain why or why not.
   This is not a fair game. You might choose to discuss ideas in number theory further with your class.
1.1c Homework: Probability Continued

Write all probabilities as fractions, decimals and percents.

1. Without using a calculator, for each pair, determine which fraction is bigger. Justify your answer.

a. \( \frac{1}{9} \) or \( \frac{1}{10} \)

b. \( \frac{8}{9} \) or \( \frac{9}{10} \)

c. \( \frac{5}{9} \) or \( \frac{5}{11} \)

d. \( \frac{5}{12} \) or \( \frac{5}{14} \)

2. A bag of marbles contains 3 red marbles, 5 blue marbles, and 2 yellow marbles.

a. What is \( P(\text{red}) \)? \( \frac{3}{10} = 0.3 = 30\% \)  

b. What is \( P(\text{blue}) \)?

c. What is \( P(\text{yellow}) \)?

d. What is the most likely outcome when drawing a marble out of the bag? Explain. Blue, \( P(B) \) is greater than either \( P(R) \) or \( P(Y) \)

e. What is the least likely outcome when drawing a marble out of the bag? Explain. Yellow, \( P(Y) \) is less than either \( P(R) \) or \( P(B) \)

f. Have you been computing theoretical or experimental probabilities? Explain.

3. A spinner contains three letters of the alphabet.

a. How many outcomes are possible if the spinner is spun three times?

b. List all of the outcomes for spinning three times.
   \[ \text{KKK, KKV, KKH, KVK, KVV, KVH, KHK, KHV, VKK, VKV, VKH, VVK, VVV, VVH, VHK, VHV, VHH, HKK, HKV, HKH, HVL, HVV, HVH, HHK, HHV, HHH.} \]
   Remember how KKV is different than VKK when order matters. In this context it does. If one were to draw 3 marbles from a bag at once, then red, red, blue is the same as blue, red, red. This will be an important distinction for secondary mathematics.

c. What is the probability of getting exactly one H in three spins?
d. What is the probability of getting two V’s on three spins? 
\[
\frac{2}{9} = 0.222\ldots = 22.\overline{2}\% 
\]
f. What outcome(s) is/are most likely for three spins? 
All individual outcomes are equally likely with a 1/27 probability.

g. What is the probability of getting a consonant in three spins?

4. Place the fractions on the number line below.
\[
\frac{2}{3}, \frac{3}{10}, \frac{1}{2}, \frac{3}{2}, \frac{4}{3}
\]

5. Order the following fractions from least to greatest.
\[
\frac{2}{3}, \frac{3}{10}, \frac{1}{2}, \frac{3}{2}, \frac{4}{3}
\]

Spiral Review

1. Model \( \frac{3}{4} \)

2. Use a number line to solve \( 24 - 7 \).

3. Simplify: \( \frac{2}{3} + \frac{3}{6} \) (if necessary).

\[
\begin{array}{c}
\text{Model:} \quad \frac{3}{4} \\
\text{"Take-away" model} \\
\text{OR} \\
\text{"Difference" model} \\
\text{Simplify:} \quad \frac{2}{3} + \frac{3}{6} \\
\end{array}
\]

Sample Problems for Section 1.1

Express all probabilities as fractions, decimals, and percents.

1. Scarlet had a bag with red, green, and blue marbles. The following table shows what color she drew each time.

<table>
<thead>
<tr>
<th>Draw</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
<th>7</th>
<th>8</th>
<th>9</th>
<th>10</th>
</tr>
</thead>
<tbody>
<tr>
<td>Result</td>
<td>red</td>
<td>green</td>
<td>blue</td>
<td>blue</td>
<td>red</td>
<td>blue</td>
<td>red</td>
<td>green</td>
<td>green</td>
<td>blue</td>
</tr>
</tbody>
</table>

a) Find the experimental probability of drawing a red marble.

b) If there are 100 marbles in the bag, how many of them do you think are red? Justify your answer.

2. Find the theoretical probabilities for each of the following:

<table>
<thead>
<tr>
<th>If you flip a penny once, what is the probability of getting heads?</th>
<th>If you spin the following spinner once, what is the probability of spinning an S?</th>
<th>If you roll a six-sided die once, what is the probability of rolling a 5?</th>
</tr>
</thead>
<tbody>
<tr>
<td>[Diagram of a spinner with 4 equal sections: P, S, S, L]</td>
<td>[Diagram of a spinner with 4 equal sections: P, S, S, L]</td>
<td>[Diagram of a six-sided die]</td>
</tr>
</tbody>
</table>

Explain how you know your answer to each of the above is correct.
b. If you flip a penny three times, what is the probability of getting heads for all three flips?

If you spin the following spinner twice, what is the probability of spinning a P and an S in any order?

If you roll a six-sided die twice, what is the probability of rolling a 5 (on either roll)?

Explain how you know your answer to each of the above is correct.

3. Tommy has 30 marbles in a bag. If \( \frac{1}{2} \) are blue, \( \frac{1}{3} \) are red, and \( \frac{1}{6} \) are yellow and he draws out a marble, records the color, returns it to the bag and repeats the process 10 times,

a) approximately how many times should he expect to draw a blue marble?

b) Suppose Tommy did the same experiment 1000 times, approximately how many times would Tommy expect to draw a blue marble?

c) Which of the two approximations is likely to be the most accurate? Justify your answer.
Section 1.2: Understand/Apply Equivalence in Rational Number Forms. Convert Between Forms (Fraction, Decimal, Percent).

Section Overview:

In this section students solidify and practice rational number sense through the careful review of fractions, decimals and percents in this section. The two key objectives of this section are: a) students should be confidently able to articulate with words, models and symbols the relationship among equivalent fractions, decimals, and percents and b) students should understand and use models to find portions of different wholes.

The concept of equivalent fractions naturally leads students to the issues of ordering and estimation. Students will represent order of fractions on the real number line. It is important that students develop estimation skills in conjunction with both ordering and operating on positive and negative rational numbers.

Lastly, students look at percent as being a fraction with a denominator of 100. Percent and fraction contexts in this section should be approached intuitively with models. In section 1.3 students will begin to transition to writing numeric expressions.

Concepts and Skills to be Mastered (from standards)

1. Express probability using appropriate fractions, decimals, and percents.
2. Express and convert between rational numbers in different forms.
3. Draw models to show equivalence among fractions and rational numbers.
4. Compare rational numbers in different forms.
5. Find the percent of a quantity using a model.
6. Solve problems with rational numbers using models.

It is important in this unit to realize that a 25% decrease is equal to 75% of the original whole while a 25% increase is equal to 125% of the original amount.
### 1.2a Class Activity: “10 × 10 Grids” & Conversion

Write the equivalent values for the following parts of a candy bar.

#### The bar on the left is divided into two parts.

1 part = \( \frac{1}{2} \) (fraction) = \( 0.5 \) (decimal) = 50% (percent)

2 parts = \( \frac{2}{2} \) (fraction) = \( 1.0 \) (decimal) = 100% (percent)

#### The bar on the left is divided into three parts.

1 part = \( \frac{1}{3} \) (fraction) = \( 0. \overline{3} \) (decimal) = 33.3% (percent)

2 parts = \( \frac{2}{3} \) (fraction) = \( 0.6 \) (decimal) = 66.6% (percent)

#### The bar on the left is divided into four parts.

1 part = \( \frac{1}{4} \) (fraction) = \( 0.25 \) (decimal) = 25% (percent)

2 parts = \( \frac{2}{4} \) (fraction) = \( 0.5 \) (decimal) = 50% (percent)

3 parts = \( \frac{3}{4} \) (fraction) = \( 0.75 \) (decimal) = 75% (percent)

#### The bar on the left is divided into five parts.

1 part = \( \frac{1}{5} \) (fraction) = \( 0.2 \) (decimal) = 20% (percent)

3 parts = \( \frac{3}{5} \) (fraction) = \( 0.6 \) (decimal) = 60% (percent)

#### The bar on the left is divided into six parts.

1 part = \( \frac{1}{6} \) (fraction) = \( 0.1 \overline{6} \) (decimal) = 16.6% (percent)

2 parts = \( \frac{2}{6} \) (fraction) = \( 0. \overline{3} \) (decimal) = 33.3% (percent)

4 parts = \( \frac{4}{6} \) (fraction) = \( 0.6 \) (decimal) = 66.6% (percent)

#### The bar on the left is divided into eight parts.

2 parts = \( \frac{1}{4} \) (fraction) = \( 0.25 \) (decimal) = 25% (percent)

7 parts = \( \frac{7}{8} \) (fraction) = \( 0.875 \) (decimal) = 87.5% (percent)
1. To the left is a 10 × 10 Grid. Why do you think it is called a 10 × 10 grid?

2. Use the grid to show the fraction \( \frac{6}{100} \). Explain why this model is correct.

Discuss why \( \frac{6}{100} = \frac{3}{50} \) using the model.

3. What fraction is shown in this 10 × 10 grid? Explain. \( \frac{36}{100} \) or \( \frac{9}{25} \)

Shade 36 boxes to show \( \frac{9}{25} \) (they might shade 9 groups of 4 → 4 is \( \frac{1}{25} \) of the whole.)

4. What is the decimal equivalent for this fraction? 0.36

Talk about \( \frac{9}{25} = \frac{9}{25} \times \frac{4}{4} = \frac{36}{100} = 0.36 \)

5. What fraction is shown in this 10 × 10 grid? \( \frac{20}{100} \) or \( \frac{1}{5} \)

6. What is the decimal equivalent for this fraction? 0.2

7. Shade the given decimal in each grid below:
   a. 0.27  
   b. 0.35  
   c. 0.4  
   d. 0.125

8. Write the fraction equivalent for each decimal, in simplest form, here.
   a. \( \frac{27}{100} \)  
   b. \( \frac{7}{20} \)  
   c. \( \frac{2}{5} \)  
   d. \( \frac{1}{8} \)
9. Shade the fractional part of each grid. Then write the fraction as a decimal and a percent. 
   (Shading may vary.)
   a. \( \frac{1}{2} \)
   b. \( \frac{1}{4} \)
   c. \( \frac{1}{10} \)
   d. \( \frac{1}{5} \)

   Decimal: 0.5  
   Percent: 50%

   Decimal: 0.25  
   Percent: 25%

   Decimal: 0.1  
   Percent: 10%

   Decimal: 0.2  
   Percent: 20%

   e. \( \frac{1}{100} \)
   f. \( \frac{1}{8} \)
   g. \( \frac{1}{3} \)
   h. \( \frac{1}{9} \)

   Decimal: 0.01  
   Percent: 1%

   Decimal: 0.125  
   Percent: 12.5%

   Decimal: 0.\overline{3}  
   Percent: 33.\overline{3}%

   Decimal: 0.\overline{1}  
   Percent: 11.\overline{1}%

10. Use long division to show how you can convert each fraction to a decimal and then a percent. Then use equivalent fractions to do the same.
   a. \( \frac{1}{2} \)
   b. \( \frac{1}{4} \)
   c. \( \frac{1}{10} \)
   d. \( \frac{1}{5} \)
   e. \( \frac{1}{100} \)
   f. \( \frac{1}{8} \)
   g. \( \frac{1}{3} \)
   h. \( \frac{1}{9} \)

1.2a Homework: Converting Between Fractions, Decimals, and Percents

1. Fill in the boxes below to show how you can convert between fractions, decimals, and percentages.

![Diagram showing conversion between fraction, decimal, and percent]

How can you write a percent as a fraction?

Write the percent as a whole number over 100, then simplify the fraction.

How can you write a fraction as a decimal?

Understand that a decimal is “out of 100;” find an equivalent fraction with a denominator of 100 or use bar model. OR Divide the numerator by the denominator.

How can you write a decimal as a percent?

Understand that decimal is out of 100; move the decimal point to the right two places and put in the percentage symbol.

Show how to use the steps you described above to complete the following problems.

2. Write 45% as a fraction. 5. Write 0.45 as a percent.

\[
\frac{45}{100} \text{ or } \frac{9}{20}
\]

3. Write \(\frac{3}{5}\) as a decimal. 6. Write 1 as a percent.

\(0.6\)

4. Write \(\frac{1}{9}\) as a decimal.

\(0.\overline{1}\)
Fill in each blank with the equivalent fraction, decimal or percent. Use bar notation for repeated decimals.

Spiral Review

1. Order the following fractions from least to greatest.
\[
\frac{1}{2}, \frac{4}{5}, \frac{1}{3}, \frac{2}{5}, \frac{1}{3}, \frac{2}{5}, \frac{1}{2}, \frac{4}{5}
\]

2. Write three-fourth as a fraction, decimal, and percent. \( \frac{3}{4} = 0.75, 75\% \)

3. Place the fractions on the number line below.
\[
\frac{6}{5}, \frac{3}{10}, \frac{1}{5}, \frac{3}{2}
\]

4. Without using a calculator, determine which fraction is bigger in the pair. Justify your answer.
\[
\frac{3}{7} \quad \text{or} \quad \frac{3}{8}
\]

For each we have 3 parts of a whole that was cut into either 7 or 8. 1/7 is larger than 1/8, so 3 groups of 1/7 is more than three groups of 1/8.
1.2b Class Activity: Using Tangrams to Understand Fractions and Decimals

Below is a square created out of tangrams.

1. With a partner, take two different colored tangram sets and recreate the square shown above.

2. Using your different colored shapes, compare the small, medium, and large triangles to each other. How do they compare in size? The medium triangle is 2 times as big as the small triangle. The large triangle is 2 times as big as the medium triangle. Thus the large triangle is 4 times as big as the small triangle.

3. Now look at the small square and parallelogram. What do you observe? They are the same portion of the whole—they have the same area. You may want to return to this idea in Chapters 5 and 8.

4. Complete each equation. Find as many solutions as possible. The first one is started for you.
   a. one small square =
      
      | one small square = 2 small triangles | one small square = $\frac{1}{2}$ of the large triangle |
      | One small square = 1 medium triangle | One small square = 1 parallelogram |

   b. one large triangle =
      
      | One large triangle = 4 small triangles | One large triangle = 2 small squares |
      | One large triangle = 2 medium triangles | One large triangle = 2 parallelograms |
c. one parallelogram =

<table>
<thead>
<tr>
<th></th>
<th>One parallelogram = 2 small triangles</th>
<th>One parallelogram = ( \frac{1}{2} ) of the large triangle</th>
</tr>
</thead>
<tbody>
<tr>
<td>One parallelogram = 1 medium triangle</td>
<td>One parallelogram = 1 small square</td>
<td></td>
</tr>
</tbody>
</table>

d. one medium triangle =

<table>
<thead>
<tr>
<th></th>
<th>One medium triangle = 2 small triangles</th>
<th>One medium triangle = ( \frac{1}{2} ) of the large triangle</th>
</tr>
</thead>
<tbody>
<tr>
<td>One medium triangle = 1 small square</td>
<td>One medium triangle = 1 parallelogram</td>
<td></td>
</tr>
</tbody>
</table>

5. Find the value of each shape relative to the entire square. Remember the square represents 1 whole. Record your findings in the table below.

<table>
<thead>
<tr>
<th>Name of Shape</th>
<th>Fraction</th>
<th>Decimal</th>
<th>Percent</th>
</tr>
</thead>
<tbody>
<tr>
<td>Large triangle</td>
<td>1/4</td>
<td>0.25</td>
<td>25%</td>
</tr>
<tr>
<td>Medium triangle</td>
<td>1/8</td>
<td>0.125</td>
<td>12.5%</td>
</tr>
<tr>
<td>Small triangle</td>
<td>1/16</td>
<td>0.0625</td>
<td>6.25%</td>
</tr>
<tr>
<td>Small Square</td>
<td>1/8</td>
<td>0.125</td>
<td>12.5%</td>
</tr>
<tr>
<td>Parallelogram</td>
<td>1/8</td>
<td>0.125</td>
<td>12.5%</td>
</tr>
</tbody>
</table>

Reduce/simplify each fraction. Draw a model to show the equivalence between the original fraction and the reduced one:

6. \( \frac{4}{10} = \frac{2}{5} \)

7. \( \frac{12}{18} = \frac{2}{3} \)

8. \( \frac{4}{12} = \frac{1}{3} \)

Find an equivalent fraction for each. Draw a model to show the equivalence between the original fraction and the new one.

9. \( \frac{1}{3} = \frac{?}{9} \quad ? = 3 \)

10. \( \frac{3}{7} = \frac{18}{?} \quad ? = 42 \)

11. \( \frac{4}{5} = \frac{?}{25} \quad ? = 20 \)

Change each to a mixed number. Draw a bar model to show the equivalence between the original fraction and the new one.

12. \( \frac{7}{5} = \frac{1}{5} + \frac{2}{5} \)

13. \( \frac{25}{3} = \frac{8}{3} + \frac{1}{3} \)

14. \( \frac{18}{4} = \frac{4}{2} \)
7. Simplify each fraction. Draw a model for questions “a” and “b” to show equivalent fractions.

<table>
<thead>
<tr>
<th>a. ( \frac{4}{6} = \frac{2}{3} )</th>
<th>b. ( \frac{3}{9} = )</th>
<th>c. ( \frac{10}{18} = \frac{5}{9} )</th>
</tr>
</thead>
<tbody>
<tr>
<td>d. ( \frac{14}{21} = )</td>
<td>e. ( \frac{9}{21} = \frac{3}{7} )</td>
<td>f. ( \frac{7}{35} = )</td>
</tr>
</tbody>
</table>

2. Write an equivalent fraction. Draw a bar model for questions “a” and “b” to show the equivalent fractions.

<table>
<thead>
<tr>
<th>a. ( \frac{1}{2} = \frac{3}{6} )</th>
<th>b. ( \frac{2}{5} = \frac{10}{15} )</th>
<th>c. ( \frac{2}{3} = \frac{10}{15} )</th>
</tr>
</thead>
<tbody>
<tr>
<td>d. ( \frac{4}{7} = \frac{14}{14} )</td>
<td>e. ( \frac{5}{8} = \frac{15}{24} )</td>
<td>f. ( \frac{3}{4} = \frac{15}{24} )</td>
</tr>
</tbody>
</table>

3. Change each fraction to a mixed number. Draw a bar model for questions “a” and “d”.

<table>
<thead>
<tr>
<th>a. ( \frac{10}{3} = 3 \frac{1}{3} )</th>
<th>b. ( \frac{29}{4} = )</th>
<th>c. ( \frac{25}{9} = 2 \frac{7}{9} )</th>
</tr>
</thead>
<tbody>
<tr>
<td>d. ( \frac{25}{12} = )</td>
<td>e. ( \frac{20}{7} = 2 \frac{6}{7} )</td>
<td>f. ( \frac{19}{5} = )</td>
</tr>
</tbody>
</table>
Spiral Review

1. Write $\frac{2}{3}$ as a decimal and percent.

\[
\begin{array}{|c|c|c|}
\hline
\frac{2}{3} & 0.6\overline{6} & 66.\overline{6}\% \text{ or } 66 \frac{2}{3}\% \\
\hline
\end{array}
\]

2. Write this model in fraction form then simplify.

\[
\frac{10}{100} - \frac{1}{10}
\]

Use long division to show how you can convert this fraction to a decimal and then a percent

a) \[
\frac{1}{5} \quad 5 \overline{1} .2 \\
\hline
.2, 20\%
\]

b) \[
\frac{3}{8} \\
0.375, 37.5\% 
\]
1.2c Class Activity: Rational Number Ordering and Estimation

1. Plot each fraction on the number line below.

a. \( \frac{1}{2}, \frac{1}{3}, \frac{3}{4}, \frac{2}{5} \)

b. \( -\frac{1}{2}, -\frac{1}{3}, -\frac{3}{4}, -\frac{2}{5} \)

![Number Line with Fractions](image)

c. Compare the fractions using <, >, or =.

\[
\frac{1}{2} > \frac{1}{3} \quad \frac{-1}{2} = \frac{-1}{3} \quad \frac{2}{5} < \frac{3}{4} \quad \frac{-2}{5} > \frac{-3}{4}
\]

d. What differences do you observe when comparing the fractions in part c?

Notice that \( \frac{1}{3} < \frac{1}{2} \) but that \( -\frac{1}{3} > -\frac{1}{2} \).

e. How does the number line help you determine which number is larger?

Numbers to the right are always larger than numbers to the left.

2. Classify these fractions as close to 0, close to \( \frac{1}{2} \), or close to 1.

\[
\frac{1}{2}, \frac{1}{9}, \frac{5}{8}, \frac{5}{6}, \frac{7}{8}, \frac{1}{5}, \frac{3}{5}, \frac{1}{7}
\]

<table>
<thead>
<tr>
<th>Close to 0</th>
<th>Close to ( \frac{1}{2} )</th>
<th>Close to 1</th>
</tr>
</thead>
<tbody>
<tr>
<td>( \frac{1}{9}, \frac{1}{5}, \frac{1}{7} )</td>
<td>( \frac{1}{2}, \frac{5}{8}, \frac{5}{6}, \frac{3}{5} )</td>
<td>( \frac{5}{6}, \frac{7}{8} )</td>
</tr>
</tbody>
</table>

3. Order the fractions from least to greatest.

Fractions: \( \frac{1}{9}, \frac{1}{7}, \frac{5}{8}, \frac{5}{6}, \frac{7}{8}, \frac{1}{2}, \frac{5}{6}, \frac{5}{8}, \frac{3}{5} \)

\[
\frac{1}{9}, \frac{1}{7}, \frac{5}{8}, \frac{5}{6}, \frac{7}{8}, \frac{1}{2}, \frac{3}{5}, \frac{5}{8}, \frac{7}{8}
\]
4. Classify these fractions as close to 0, close to \( \frac{1}{2} \), close to -1.

\[
\frac{-1}{2'}, \frac{-4}{28'}, \frac{-3}{5'}, \frac{-2}{7'}, \frac{-5}{14'}, \frac{-2}{11'}, \frac{-4}{9'}
\]

If students struggle with this, have them plot each as positive numbers and then reflect over 0.

<table>
<thead>
<tr>
<th>Close to 0</th>
<th>Close to ( \frac{1}{2} )</th>
<th>Close to -1</th>
</tr>
</thead>
<tbody>
<tr>
<td>( -\frac{4}{28'} ), ( -\frac{2}{11'} )</td>
<td>( -\frac{1}{2'}, -\frac{2}{7'}, -\frac{2}{7'}, -\frac{5}{14'} )</td>
<td>( -\frac{4}{5'}, -\frac{7}{9'} )</td>
</tr>
</tbody>
</table>

5. Order the above numbers from least to greatest.

Fractions: \( \frac{-4}{28'}, \frac{-2}{11'}, \frac{-7}{9'}, \frac{-3}{5'}, \frac{-1}{2'}, \frac{-5}{14'}, \frac{-2}{11'}, \frac{-4}{9'} \)

Now approximate their location on the number line below:

6. Approximate where each value is located on the number line below. State a “common” fraction and decimal you can use to help you find the approximate location for each. The first one is done for you.

\[
\begin{array}{c|c|c|c|c|c|c|c|c|c}
\hline
&-3&-2.5&-2&-1.5&-1&-0.5&0&0.5&1&1.5&2&2.5&3 \\
\hline
\hline
a. 0.32 \approx 0.333 \approx \frac{1}{3} & b. 0.67 \approx 0.666 \approx \frac{2}{3} & c. 0.76 \approx 0.75 \approx \frac{3}{4} & d. 0.98 \approx \frac{1}{1} \\
e. -0.24 \approx -0.25 \approx -\frac{1}{4} & f. 2.32 \approx 2.333 \approx 2 \frac{1}{3} & g. -3.38 \approx -3.4 \approx -\frac{3}{2} & h. 1.76 \approx 1.75 \approx 1 \frac{3}{4} \\
\hline
\end{array}
\]

Plot each fraction on the number line. Fill in the blank using <, >, or =.

7. \( \frac{4 \frac{3}{10}}{10} \quad > \quad 4 \frac{2}{7} \)

8. \( -4 \frac{3}{10} \quad < \quad -4 \frac{2}{7} \)
Plot each fraction on the number line. Fill in the blank with <, >, or =. How do you know your answer is correct? Justify your answer.

9. $0.14 > 0.14$
   Justification:

10. $-2.15 < -2.13$
    Justification:

11. $0.15 = \frac{3}{20}$
    Justification:

12. $2\frac{2}{3} > 2.6$
    Justification:

13. $-0.3 > -\frac{1}{3}$
    Justification:

14. Is 0.74 to the left or right of $\frac{3}{4}$? Explain.
   0.74 is left of $\frac{3}{4}$ because it’s smaller: $\frac{3}{4} = 0.75$

15. Is 1.26 to the left or right of $1\frac{1}{4}$? Explain.
   1.26 is right of $1\frac{1}{4}$ because it’s larger: $1\frac{1}{4} = 1.25$

16. Give a fraction and decimal approximation of $\frac{71}{102}$.
   This is approximately $75/100$, so approximately 0.75. The estimate is a bit larger than the original.
   OR approximately $70/100$, so approximately $7/10 = 0.7$.

17. Give a fraction and decimal approximation of $\frac{9}{23}$.
   Some students may say $40/100 = 2/5$ or 0.4 However, $8/24$ or 0.33 repeating is far better. Stress with students that you’re estimating, but that you want to get as close as possible.
1.2c Homework: Rational Number Ordering and Estimation

*ESTIMATE* each of the following. Justify your answer with either words or a model. Indicate if your estimate is larger or smaller than the exact answer.

<table>
<thead>
<tr>
<th>Fraction</th>
<th>≈ Decimal</th>
<th>≈ Percent</th>
<th>Justification</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 $\frac{11}{21}$</td>
<td>0.50</td>
<td>50%</td>
<td>11 is a little more than half of 21; it’s about 10/20</td>
</tr>
<tr>
<td>2 $\frac{16}{27}$</td>
<td></td>
<td>66.7%</td>
<td>16 is a little less than 2/3 of 27; it’s about 18/27</td>
</tr>
<tr>
<td>3 $\frac{89}{99}$</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>4 $\frac{13}{17}$</td>
<td>0.75</td>
<td></td>
<td></td>
</tr>
<tr>
<td>5 $\frac{5}{23}$</td>
<td></td>
<td></td>
<td>This is close to $\frac{5}{25}$ or $\frac{1}{5}$. Students might also say 5/20 or 1/4.</td>
</tr>
</tbody>
</table>

Fill in the blank with <, >, or =. Justify each with a picture or number-line or explanation.

6. $1\frac{4}{25}$ 1.2
   Justification:

7. $-1\frac{4}{25}$ $>$ $-1.2$
   Justification:

8. $-2.34$ $-$ $2\frac{4}{11}$
   Justification:
9. \( \frac{5}{11} = 0.45 \)  
   Justification:

10. \( \frac{5}{6} \)  \( \frac{10}{13} \)  
    Justification:

11. \( -\frac{19}{20} < -3.94 \)  
    Justification:

12. Order the following set of numbers from least to greatest: \( \frac{3}{4}, 1.73, \frac{3}{5}, 1.78 \)

13. Order the following set of numbers from least to greatest: \( -0.26, -\frac{3}{10}, -0.35, -\frac{6}{25} \)

14. Plot each rational number on the number line. Write them in order from least to greatest:

\[
\frac{3}{8}, 0.38, \frac{3}{7}, 0.43
\]

---

**Spiral Review**

Change each fraction to a mixed number. Draw a bar model for each.

1. \( \frac{7}{3} \)  \( 2 \frac{1}{3} \)
2. \( \frac{11}{3} \)  \( 3 \frac{2}{3} \)
3. Compare these two fractions: \( \frac{6}{12} \)  \( \frac{8}{14} \)
It is important in this unit to realize that a 25% decrease is equal to 75% of the whole. It is a good idea to always have students identify the part, whole and percent in the problems at the end.

1. A bag contains 100 marbles. The table below shows how many red, blue, green and yellow marbles are in the bag. Use that data to complete the table below. The first row is completed for you.

<table>
<thead>
<tr>
<th>Color of Marble</th>
<th>Probability of drawing the colored marble</th>
<th>Ratio of colored marble to all marbles</th>
<th>Percentage of colored marble within all marbles</th>
</tr>
</thead>
<tbody>
<tr>
<td>Red</td>
<td>( \frac{16}{100} = \frac{4}{25} )</td>
<td>( \frac{16}{100} = \frac{4}{25} )</td>
<td>16%</td>
</tr>
<tr>
<td>Blue</td>
<td>( \frac{24}{100} = \frac{6}{25} )</td>
<td>( \frac{24}{100} = \frac{6}{25} )</td>
<td>24%</td>
</tr>
<tr>
<td>Green</td>
<td>( \frac{45}{100} = \frac{9}{20} )</td>
<td>( \frac{45}{100} = \frac{9}{20} )</td>
<td>45%</td>
</tr>
<tr>
<td>Yellow</td>
<td>( \frac{15}{100} = \frac{3}{20} )</td>
<td>( \frac{15}{100} = \frac{3}{20} )</td>
<td>15%</td>
</tr>
<tr>
<td>Orange</td>
<td>( \frac{0}{100} = 0 )</td>
<td>( \frac{0}{100} = 0 )</td>
<td>0%</td>
</tr>
<tr>
<td>Red OR blue</td>
<td>( \frac{16 + 24}{100} = \frac{40}{100} = \frac{2}{5} )</td>
<td>( \frac{16 + 24}{100} = \frac{40}{100} = \frac{2}{5} )</td>
<td>40%</td>
</tr>
<tr>
<td>Red, blue, green OR yellow</td>
<td>( \frac{16 + 24 + 45 + 15}{100} = \frac{100}{100} = 1 )</td>
<td>( \frac{100}{100} = 1 )</td>
<td>100%</td>
</tr>
</tbody>
</table>
2. Suppose you want to create a bag with 300 red, blue, green and yellow marbles that has the same probability for drawing each color as #1 above. Find how many of each color you will need.

<table>
<thead>
<tr>
<th>Color</th>
<th>Probability→Amount</th>
<th>Percent→Amount</th>
<th>Model</th>
</tr>
</thead>
<tbody>
<tr>
<td>Red</td>
<td>$\frac{4}{25} = \frac{12}{300}$ or $\frac{4}{100} = \frac{3}{300}$</td>
<td>$16% = \frac{16}{100}$</td>
<td>$16 \div 3 = 48$ red marbles</td>
</tr>
<tr>
<td>Blue</td>
<td>$\frac{24}{100} = \frac{72}{300}$</td>
<td>$24 \div 3 = 72$ blue marbles</td>
<td></td>
</tr>
<tr>
<td>Green</td>
<td>$\frac{45}{100} = \frac{135}{300}$</td>
<td>$45 \div 3 = 135$ green marbles</td>
<td></td>
</tr>
<tr>
<td>Yellow</td>
<td>$\frac{15}{100} = \frac{45}{300}$</td>
<td>$15 \div 3 = 45$ yellow marbles</td>
<td></td>
</tr>
</tbody>
</table>

### Modeling to find the part, whole or percent

**Example 1:** Sally wants to compute $60\%$ of 145. She knows that $60\% = \frac{60}{100} = \frac{6}{10} = \frac{3}{5}$. This means that 145 should be divided into either 100, 10 or 5 parts. Dividing 145 into 10 parts would mean 1.45 in each part, dividing into 10 parts would mean 14.5 in each part; dividing into 5 parts would mean 29 in each part. She decided to use 5:

```
  29 29 29 29 29
```

Sixty percent of 145 is the same as $3/5$ of 145; thus $60\%$ of 145 is $29 + 29 + 29$ or 87.
**Example 2:** What percent of 195 is 78?

We know that 10% of 195 is 19.5. So one way to think about this is to divide 195 into ten parts:

![Diagram showing 195 divided into ten parts with four parts shaded to represent 40%]

Above we can see that two 10% portions make 39; thus four 10% portions make 78. So, 78 is 40% of 195.

**Example 3:** 15% of what is 45?

We know that percents are relationships of 100 and that if we can find 10%, we can compute anything fairly easily. If 45 is 15% of the whole, then 15 is 5% of the whole (15% divided into 3 is 5%, and 45 divided into 3 is 15.) That means that 5% of the whole is 15, so 10% is 30:

![Diagram showing 45 shaded to represent 15%]

If each 10% portion is 30, than the whole is 30 × 10 or 300.
Use a model like the one shown previously to answer the following questions. The key to drawing these models is to convert the percent to a fraction. Help students see the connection between fractional and percent portions.

3. Find 60% of 180. 108

4. Find 40% of 80. 32

5. Find 25% of 324. 81

6. 12 is 10 percent of what number? 120

7. What percent of 80 is 60? 75%

8. What percent of 95 is 19? 20%

9. 12 is 10 percent of what number? 120

10. 45 is 15 percent of what number? 300

11. 30 is 25 percent of what number? 120
# 1.2d Homework: Probability, Fractions, and Percentage

## Express each fraction as a percent.

<table>
<thead>
<tr>
<th>Fraction</th>
</tr>
</thead>
<tbody>
<tr>
<td>$\frac{1}{5}$</td>
</tr>
<tr>
<td>$\frac{9}{10}$</td>
</tr>
</tbody>
</table>

## Express each percent as a fraction in simplest forms

<table>
<thead>
<tr>
<th>Percent</th>
<th>Fraction</th>
</tr>
</thead>
<tbody>
<tr>
<td>60%</td>
<td>$\frac{3}{5}$</td>
</tr>
<tr>
<td>80%</td>
<td>$\frac{3}{4}$</td>
</tr>
<tr>
<td>75%</td>
<td>$\frac{3}{4}$</td>
</tr>
</tbody>
</table>

## Solve each using a model and mental math. Show your work:

11. Find 80% of 150.

12. Find 40% of 40.

13. What percent of 30 is 15?

14. What percent of 240 is 60?

15. 40 is 8% of what number?

16. 60 is 30% of what number?
Use a model to ESTIMATE each. Indicate if your estimate is slightly higher or lower than the exact answer.
Answers may vary.
17. Estimate 74% of 24.
   74% is close to 75% = 3/4 and 3/4 of 24 = 18; high estimate

18. Makayla got a score of 77% on her English final. If there were 48 questions on the test, approximately how many questions did she get right?

19. Milo can run 10 miles in 60 minutes. He needs to reduce his time by 18%, approximately how many minutes does he have to take off his time?
   12 minutes, high estimate

20. The cycle store has a bike regularly priced at $660, Tom negotiated a 32% discount. What fraction can you use to estimate the money he saved? Approximately how much did he pay for the bike?

   Plot each fraction on the number line. Fill in the blank with <,>, or +. How do you know your answer is correct. Justify your answer.

   Spiral Review
   1. Circle the number that’s greater: 0.17 0.107
      Justification: 0.17 is greater

   2. Circle the number that’s greater: 2.65 2.63
      Justification: 2.65 is greater

   3. I 0.77 to the left or right of 3/4 on a number line? Explain.
      0.77 is to the right of 3/4 because it’s bigger: 3/4 = 0.75

   4. Write 32% as a decimal and fraction. 0.32; 8/25
1.2e Class Activity: Applications with Models, Multi-Step Problems

Percent and fraction questions: Use a model to find the solutions.

1. 60 is 40% of what number? 150

2. There are 36 students in a math class. $\frac{3}{4}$ of the students take an art class after their math class, the rest take a social studies class. How many students take art after math? 27 students

3. You get 80% correct on a history quiz with 150 questions. How many questions did you get correct? 120 questions

4. Juan earned money for creating a webpage for a local business. He used $\frac{1}{2}$ of the money he earned for new shoes and $\frac{2}{3}$ of the rest for music. He has $20 left. How much money did he earn for his work? $120$

   $20 \cdot 3 \cdot 2 = 120$

   Emphasize that “2/3 of the rest” is not the same as 2/3 of the whole.

5. Lydia volunteers with an organization that helps older citizens take care of their yards. 75% of the volunteers in the organization are 20-30 years old. Of the remaining portion, 75% are over 30 and 25% are under 20. If there are 15 people under 20, how many people are in the organization?

240 people
6. There are 360 7th grade students at Eisenhower Middle School. One-fourth of the students went to Clermont Elementary. Of the rest, half went to Central Elementary and the others came from a variety of other elementary schools. How many students came from Central Elementary?

135 students from Central Elementary

7. A snowboard at a local shop normally costs $450. Over Labor Day weekend, the snowboard is on sale for 50% off. Customers who make their purchase before 8:00 AM earn an additional 10% off of the sale price. If Mia buys the snowboard before 8:00 AM, how much will she pay?

$202.50

8. A local business is reviewing their expenditures. They found that they spend $\frac{1}{3}$ of their income on payroll, another $\frac{1}{2}$ goes back into the business to purchase inventory and pay for the facility, $\frac{1}{3}$ of the remainder goes to paying off their original small business loan. If they have $100,000 left to reinvest in their company, what are their total expenditures?

$900,000

9. At a Monument Valley High School, three fourths of the 7th grade students went to Salt Lake City on a field trip. Half of the rest of the students went to Monticello for a different field trip. If there were 12 students that did not go on either trip, how many 7th grade students are there in all?

96 students in 7th grade

10. Camilla earned $160 over the summer. If she put 80% of her earnings into her savings account and spent 75% of the rest on a gift for her mother, how much money did she have left over?

$8

11. Mila rode in a bike tour across Utah. On one particular day, 40% of her ride was uphill. Of the rest of her ride, 1/3 was downhill and 2/3 was flat. If the flat portion of her ride was 36 miles, how far did she ride that day?

90 miles

12. Marco’s football team was 20 yards from the goal when they got possession of the football. At the end of one play, they got half way to the goal. After the second play, they made half that distance closer to the goal. After the third play, they got half the remaining distance. How far were they from the goal line before the fourth play? $20(1/2)(1/2)(1/2) = 20/8 = 5/2 = 2.5$ yards from the goal.
1.2e Homework: Rational Numbers with Models, Multi-Step Problems

Use a model to fill in the table below:

<table>
<thead>
<tr>
<th>Fraction</th>
<th>Decimal</th>
<th>Percent</th>
</tr>
</thead>
<tbody>
<tr>
<td>3/5</td>
<td>0.6</td>
<td>60%</td>
</tr>
<tr>
<td>4/25</td>
<td></td>
<td></td>
</tr>
<tr>
<td>3/20</td>
<td>0.15</td>
<td>15%</td>
</tr>
<tr>
<td>2/3</td>
<td></td>
<td></td>
</tr>
<tr>
<td>9/20</td>
<td>0.45</td>
<td>45%</td>
</tr>
</tbody>
</table>

Use a model to solve each problem.

6. Marisa earned money for helping a local business with organizing their inventory. She spent half of her earnings on accessories for her phone, and half of the remaining money on a gift for her mother. If she has $15 left, how much did she make organizing the inventory? $60

6 was remaining. It is ½ of the remaining, so was $30. $30 is ½ of the total, so the total is $60.

7. Pedro has $80 left from the money he earned during the summer helping at his father’s business. He had spent 1/3 of his earnings on climbing equipment, 1/3 on camping gear and 1/2 of the remainder on entertainment during the summer. How much did he earn during the summer?
8. Jose estimates that 50% of his income goes toward living expenses (rent, utilities and food). Of the rest, 50% goes to paying for his car and 25% to other expenses. If Jose has $300 left at the end of the month, how much does he earn?

9. Marco earned $360 helping his grandfather at his business. He spent \( \frac{1}{4} \) of his earnings on a gift for his mother and put \( \frac{2}{3} \) of the rest into a savings account. How much does he have left over for fun?

\[ \$90 \]

10. Julia found a great pair of boots for $240, but that was more than she wanted to spend. A few months later they were on sale for 40% off. She searched online and found a coupon for 25% off the sale price. How much will she pay for the boots? \[ \$108 \]

11. Jose earned money over the summer working at his family's store. He put three-fourths of the money he earned in his savings account and spent half of the rest. If he has $120 left over, how much did he earn?

12. Jessi bought 18 gallons of paint to paint her house and garage. If she used 75% of the paint on the house and half of the rest on the garage, how much paint did she have left over?

\[ 2.25 \text{ gallons} \]

---

### Spiral Review

Express each fraction as a percent.

1. \( \frac{1}{5} = 20\% \)

3. \( \frac{2}{3} = \) \[ \] 

Express each percent as a fraction in simplest form.

3. 40% \( \frac{2}{5} \)

4. 25% \( \frac{1}{4} \)
1.2f Self-Assessment: Section 1.2

Consider the following skills/concepts. Rate your comfort level with each skill/concept by checking the box that best describes your progress in mastering each skill/concept. Corresponding sample problems, referenced in brackets, can be found on the following page.

<table>

</tbody>
</table>

3. Order the numbers in each box from least to greatest.

   **Set A**
   
   \[ \frac{1}{2}, \frac{3}{4}, \frac{4}{9}, 5.15, 5.002, 4.7, 5.1 \]
   
   **Set B**
   
   \[ \frac{1}{2}, \frac{3}{4}, \frac{4}{9}, 7.34, 7.002, 7.7, 7.2 \]

   **Set C**
   
   \[ \frac{2}{7}, 0.24, \frac{1}{2}, 0.8, 2.54, \frac{5}{2}, 2.7, \frac{15}{7} \]
   
   **Set D**
   
   \[ \frac{1}{4}, \frac{1}{3}, 0.66, 0.1, \frac{10}{9}, \frac{4}{36} \]

   \[ 2.15, \frac{17}{7}, 2.7, 2.105, 4, \frac{5}{8}, 0.4, \frac{3}{8} \]

   \[ 1.4, \frac{10}{8}, \frac{4}{3}, 1.08 \]
4. Find each.
   a. 40% of what number is 50?
   b. What is 85% of 420?

5.  
   | a. Shauna wants to buy a sweater at the store. The sweater is normally $28, but today it is on sale for 15% off. How much is the sweater? |
   | b. In Mr. Garcia’s 7th Grade Math class, $\frac{4}{5}$ of the students brought a pencil to class. If 6 people did not have pencils, how many students are in Mr. Garcia’s class? |
   | c. Uzumati has $80. He spends $\frac{1}{5}$ on groceries. Then he spends 75% of what’s left on two new Blu-ray’s. How much money does he have left? |
   | d. Ms. Wells surveyed her 205 students. She found that 80% of the students were wearing blue jeans. One student was wearing shorts. Of the remaining students, $\frac{3}{8}$ were wearing skirts. How many students were wearing skirts? |
Section 1.3: Solve Percent Problems Including Discounts, Interest, Taxes, Tips, and Percent Increase or Decrease.

Section Overview:

In this section, students continue to solve contextual problems with fractions, decimals and percent but begin to transition from relying solely on models to writing numeric expressions. In future chapters, students will extend their understanding by writing equations and proportional equations using variables.

Concepts and Skills to be Mastered (from standards)

1. Find a percent or fractional portion of a whole with or without a model.
2. Solve percent problems involving percent increase and decrease (including discounts, interest, taxes, tips, etc.).
3. Develop numeric expressions from percent and fraction models.
1.3a Class Activity: Model Percent and Fraction Problems

Use a model to solve each of the following multi-step problems. Then write a number sentence that reflects your model and answer.

1. Larry has a piece of rope that’s 12 feet long.
   a. He cuts off 25% of the rope off. How long is the rope now? 9 feet long

   ![Diagram of rope with 25% cut off]

   $$12 - (0.25)12 = 12 - 3 = 9$$ or $$12 - (0.25)12 = (0.75)12 = 9$$

   b. Joe has a rope that is 25% longer than Larry’s 12 foot long rope. How long is Joe’s rope? 15 feet long

   ![Diagram of rope extended by 25%

   $$12 + (0.25)12 = 12 + 3 = 15$$ or $$12 + (0.25)12 = (1.25)12 = 15$$

2. Lydia invested $150. If Lydia earned 10% on her investment. How much money would she now have? $165

   How much money would Lydia have if instead she lost 10% on her original investment? $135

3. A refrigerator costs $1200 wholesale. If the mark-up on the refrigerator is 20%, what is the new price? $1440

4. Rico's resting heart rate is 50 beats per minute. His target exercise rate is 350% of his resting rate. What is his target rate? 175 beats per minute

   ![Diagram of beats per minute]

   $$50(3) + 50(1/2) = 150 + 25 = 175$$

5. A pair of boots was originally priced at $200. The store put them on sale for 25% off. A month later, the boots were reduced an additional 50% off the previous sale price. What is the price now? $75

6. Marie went out for dinner with her friend. The dinner cost $24. Tax is 5% and Marcie wants to leave a 15% tip (she computed tip on the cost of dinner and tax.) How much will Marcie pay all together for dinner? $28.98; mention that you’d likely leave $29.00

   $$24 + 0.05(24) = 25.20; 25.20 + 0.15(25.20) = 28.98$$
1. Last year Cory harvested 42 tomatoes from his backyard garden. This year, his harvest increased by 1/3. How many tomatoes did he harvest this year?

\[ 42 + \frac{1}{3} \times 42 = 56 \text{ tomatoes} \]

2. Jerry is taking care of a vacant lot in his neighborhood. There are approximately 64 thistle weeds in the lot. He decided to try a homemade weed killer his grandmother suggested. Five weeks later, the thistles have decreased by 75%. Approximately how many thistles are in the vacant lot now?

\[ 64 \times (1 - 0.75) = 16 \text{ thistles} \]

3. Maria is learning to play golf. She has been working particularly hard on driving. Before lessons, her drives average 240 yards. After her first lesson, her drives increase 25%. After her second lesson, they increase another 25%. How far are her average drives after two lessons?

Lesson #1
\[ 240 + 0.25 \times 240 = 300 \text{ yards} \]

Lesson #2
\[ 300 + 0.25 \times 300 = 375 \text{ yards} \]
4. Two stores have the same skateboard on sale. The original price of the skateboard is $200. At store AAA, it’s on sale for 30% off with a rewards coupon that allows the purchaser to take an additional 20% off the sale price at the time of purchase. At store BBB, the skateboard is on sale for 50% off. Will the price for the skateboard be the same at both stores? If not, which store has the better deal?

5. Two schools start with 1000 students. The first school’s enrollment increase 20% in 2012 and then decreases 20% in 2013; the second school’s enrollment stays constant in both 2012 and 2013. Which school has the most students now?

First school: 2012 enrollment 1200 students, 2013 enrollment 960
Second school: 2012 enrollment 1000 students, 2013 enrollment 1000

The second school has more students in 2013

Review questions. Write all probabilities as fractions, decimals and percentages.
6. Suppose you were to roll a fair 6-sided number cube once, then flip a coin. List all the possible outcomes.

1H, 2H, 3H, 4H, 5H, 6H, 1T, 2T, 3T, 4T, 5T, 6T

7. What is the probability of getting a 2 and heads?

8. What is the probability that you would roll an even number and flip heads? $\frac{3}{12} = \frac{1}{4} = 0.25 = 25\%$

9. What is the probability that you would roll an even number or flip heads?
Spiral Review

1. What is 85% of 420?

2. Fill in the equivalent decimal and percent for fraction:

<table>
<thead>
<tr>
<th>Fraction</th>
<th>Decimal</th>
<th>Percent</th>
</tr>
</thead>
<tbody>
<tr>
<td>9/15</td>
<td>.6</td>
<td>60%</td>
</tr>
</tbody>
</table>

3. Jana wants to buy a shirt at the store. The shirt is normally $24, but today it’s on sale for 15% off.
   a. How much will she save?

   15% = $3.60

   b. How much will Jana pay for the shirt?

   $24.00 - $3.60 = $20.40

4. Change this fraction to a mixed number. Draw a bar model.

   \[ \frac{8}{3} = 2 \frac{2}{3} \]

5. What is the greatest common factor of 12 and 18? 6

1.3b Class Activity: Percent and Fraction Problems Transition to Numeric Expressions
Part A: For each problem below, use a model to answer the question.

<table>
<thead>
<tr>
<th>Context</th>
<th>Model</th>
<th>Fraction Change</th>
<th>Percent Change</th>
<th>Fractional Portion of the original</th>
<th>Percent of the original</th>
</tr>
</thead>
<tbody>
<tr>
<td>1a. Li planted a 12 foot tall tree in her yard. 10 years later it is 18 feet tall.</td>
<td>[Diagram of tree growth]</td>
<td>$\frac{1}{2}$ factor increase of the original.</td>
<td>Grew by 50% of the original.</td>
<td>$\frac{3}{2}$ of the original height</td>
<td>150% of the original height</td>
</tr>
<tr>
<td>2a. Pedro had $600 in his savings account. Five years later he has $800.</td>
<td>[Diagram of money increase]</td>
<td>$\frac{1}{3}$ factor increase of the original.</td>
<td>It grew by 33.3%</td>
<td>$\frac{4}{3}$ of the original amount</td>
<td>133.3% of the original amount</td>

Sample Problems for Section 1.3

1. Solve each of the following problems with or without a model.
   a. Ana has 75 necklaces. She sells \( \frac{1}{3} \) of the necklaces. How many necklaces did she sell?

   b. Bubba invested $760. If he earned 20% on his investment,
      i. How much interest did he earn?
      ii. How much money does he have now?

   c. The bakery normally sells one dozen cupcakes for $24. Today, the cupcakes are 25% off.
      i. What is the discount for one dozen cupcakes?
      ii. If 5% tax is added to the total after the discount, how much will two dozen cupcakes cost?

2. Solve the following problems with or without a model.
   a. Daniel left a $9 tip for the waiter at a restaurant. If the tip was 15% of the bill, how much was the bill?

   b. Ellie borrowed money from a company that charges 20% interest for loans. If she repaid them a total of $420, how much was her original loan?

   c. Flo sold 14 cars last year. This year, she sold 35 cars. What was the percent change?

   d. Gabrielle had $90 in her savings account last month. Now she has $63 in her account. What was the percent change?
3. Match the context with the correct model, and numeric expression.

<table>
<thead>
<tr>
<th>Context</th>
<th>1. Hans had $75 in his bank account. Two years later, he had $100.</th>
<th>2. Isi could do 75 sit-ups last year. Now she can only do 50 sit-ups.</th>
<th>3. Jenna’s family used 75 gallons of water per day last month. This month, her family used 125 gallons of water per day.</th>

Chapter 2 Operations with Rational Numbers
(4 weeks)

UTAH CORE Standard(s)

Number Sense:
1. Apply and extend previous understandings of addition and subtraction to add and subtract rational numbers; represent addition and subtraction on a horizontal or vertical number line diagram. 7.NS.1
   a. Describe situations in which opposite quantities combine to make 0. For example, a hydrogen atom has 0 charge because its two constituents are oppositely charged. 7.NS.1a
   b. Understand \( p + q \) as the number located a distance \(|q|\) from \( p \), in the positive or negative direction depending on whether \( q \) is positive or negative. Show that a number and its opposite have a sum of 0 (are additive inverses). Interpret sums of rational numbers by describing real-world contexts. 7.NS.1b
   c. Understand subtraction of rational numbers as adding the additive inverse, \( p - q = p + (-q) \). Show that the distance between two rational numbers on the number line is the absolute value of their difference, and apply this principle in real-world contexts. 7.NS.1c
   d. Apply properties of operations as strategies to add and subtract rational numbers. 7.NS.1d

2. Apply and extend previous understandings of multiplication and division and of fractions to multiply and divide rational numbers. 7.NS.2
   a. Understand that multiplication is extended from fractions to rational numbers by requiring that operations continue to satisfy the properties of operations, particularly the distributive property, leading to products such as \((-1)(-1) = 1\) and the rules for multiplying signed numbers. Interpret products of rational numbers by describing real-world concepts. 7.NS.2a
   b. Understand that integers can be divided, provided that the divisor is not zero, and every quotient of integers (with non-zero divisor) is a rational number. If \( p \) and \( q \) are integers, then \(-p/q = (-p)/q = p/(-q)\). Interpret quotients of rational numbers by describing real-world contexts. 7.NS.2b
   c. Apply properties of operations as strategies to multiply and divide rational numbers. 7.NS.2c
   d. Convert a rational number to a decimal using long division; know that the decimal form of a rational number terminates in 0s or eventually repeats. 7.NS.2d

3. Solve real-world and mathematical problems involving the four operations with rational numbers. 7.NS.3

CHAPTER OVERVIEW:
In Chapter 2, students extend and formalize their understanding of the number system, including arithmetic with negative rational numbers. In the first two sections of the chapter, students extend their understanding of the properties of arithmetic to operating with integers. Section 1 focuses on adding and subtracting integers, while section 2 focuses on multiplication and division with integers. By section 3, students operate with all rational numbers by applying the rules they learned in the previous two sections for working with integers. Throughout all three sections, students will increase their proficiency with mental arithmetic by articulating strategies based on properties of operations.

VOCABULARY:
additive inverse, difference, integers, multiplicative inverse, opposites, product, quotient, rational numbers, repeating decimal, sum, terminating decimal, zero pairs.
CONNECTIONS TO CONTENT:

Prior Knowledge
In 6th grade students understand that positive and negative numbers are used together to describe quantities having “opposite” directions or values. They use positive and negative numbers to represent quantities in real-world contexts, explaining the meaning of 0 in each situation. Students recognize opposite signs of numbers as indicating locations on opposite sides of 0 on the number line and recognize that the opposite of the opposite of a number is the number itself. Student should come to 7th grade knowing how to locate integers on the real line as well as positive rational numbers. In Chapter 1, students have placed negative rational numbers on the number line and this chapter will expand on that knowledge.

Students also build on their prior understanding of addition (joining), subtraction (take-away or comparison), multiplication (repeated addition) and division (the inverse of multiplication). In previous grades students modeled these operations with manipulatives and on a number line (positive side only). They will now extend these strategies to working with integers and negative rational numbers. Note that 7th Grade will be students’ first experience operating with negative numbers.

Future Knowledge
The development of rational numbers in 7th grade is a progression in the development of the real number system that continues through 8th grade. In high school students will move to extending their understanding of number into the complex number system. Note that through 7th grade students find points on the real line that correspond to quantities, e.g. students will locate −3/8 on the real line in 7th grade. In 8th grade, students do something different; they start with lengths and try to identify the location that corresponds to the length. For example, students might find that the length of the hypotenuse of a right triangle is √5, they then try to identify the number that corresponds to that length.

In later courses, students will also know and apply the properties of integer exponents to generate equivalent numerical expressions, for example, \(3^2 \times 3^{-5} = 3^{-3} = 1/3^3 = 1/27\). Students will use the rules for operations on integers when solving linear equations with integer coefficients, including equations whose solutions require expanding expressions using the distributive property and collecting like terms.

In this chapter, attention is paid to understanding subtraction as the signed distance between numbers. This idea extends into geometric ideas in later mathematics such as subtraction of vectors.
### MATHEMATICAL PRACTICE STANDARDS (emphasized):

<table>
<thead>
<tr>
<th>Make sense of problems and persevere in solving them</th>
<th>Students explain and demonstrate operations on integers using symbols, visuals, words, and real life contexts. Students demonstrate perseverance while using a variety of strategies (number lines, chips/tiles, drawings, etc.)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reason abstractly and quantitatively</td>
<td>Students demonstrate quantitative reasoning with integers by representing and solving real world situations using visuals, numbers, and symbols. They demonstrate abstract reasoning by translating numerical sentences into real world situations or for example reasoning that $a - (-b)$ is the same as $a + b$.</td>
</tr>
<tr>
<td>Construct viable arguments and critique the reasoning of others</td>
<td>Students justify rules for operations with integers using appropriate terminology and tools/visuals. Students apply properties to support their arguments and constructively critique the reasoning of others while supporting their own position with models and/or properties of arithmetic.</td>
</tr>
<tr>
<td>Model with mathematics</td>
<td>Students model understanding of integer operations using tools such as chips, tiles, and number lines and connect these models to solve problems involving real-world situations and rules of arithmetic. For example, students will be able to use a model to explain why the product of two negative integers is positive.</td>
</tr>
<tr>
<td>Attend to precision</td>
<td>Students demonstrate precision by using correct terminology and symbols when working with integers. Students use precision in calculation by checking the reasonableness of their answers. Additionally, students will use properties of arithmetic to justify their work with integers, expressions and equations.</td>
</tr>
<tr>
<td>Look for and make use of structure</td>
<td>Students look for structure when operating with positive and negative numbers in order to find algorithms to work efficiently. For example, students will notice that subtracting a negative integer is the same as adding its opposite or that when a product involves an even number of negative integers, the product is always positive.</td>
</tr>
<tr>
<td>Use appropriate tools strategically</td>
<td>Students demonstrate their ability to select and use the most appropriate tool (paper/pencil, manipulatives, or calculators) while solving problems with integers. They also learn to estimate answers before using a calculators. Students should recognize that the most powerful tool they possess is their ability to reason and make sense of problems.</td>
</tr>
<tr>
<td>Look for and express regularity in repeated reasoning</td>
<td>Students will use manipulatives to explore the patterns of operations with integers. Students will use these patterns to develop algorithms. They can use these algorithms to solve problems with a variety of problem solving structures.</td>
</tr>
</tbody>
</table>
2.0 Anchor Problem: Operations on the Number Line

A number line is shown below. The numbers 0 and 1 are marked on the line, as are two other numbers $a$ and $b$.

Which of the following numbers is negative? Choose all that apply. Explain your reasoning.

1. $a - 1$
2. $a - 2$
3. $-b$
4. $a + b$
5. $a - b$
6. $ab + 1$
Section 2.1: Add and Subtract Integers; Represent Using Chip/Tile Model and Number Line Model.

Section Overview:
Section 2.1 is the first time students add and subtract integers. For this reason, it is important to begin with hands-on manipulatives and number lines, gradually working towards developing the rules of arithmetic with integers and then ultimately adding and subtracting integers without models. The goal in this section is to build intuition and comfort with integer addition and subtraction so that by the end of the section students can reason through addition and subtraction of integers without a model.

Students start by working with “opposites” (additive inverses) to notice that pairs of positives and negatives result in “zero pairs.” They then move to adding integers. Students know from previous grades that the fundamental idea of addition is “joining.” Students should notice that joining positive and negative numbers results in one or more “zero pairs” and that the “left over” is the final sum. Students will develop this idea first with a chip or tile model and the number line.

Next, students move to subtraction. Students begin by reviewing from previous grades that there are two ways to think concretely about subtraction: i) “take-away;” Anna Maria has 5 gummy bears. Jose eats 3. How many gummy bears does she now have? 5 – 3, thus 2 gummy bears. ii) “Comparison;” Anna Maria has 5 gummy bears, Jose has 3 gummy bears, how many more gummy bears does Anna Maria have than Jose? Again, the operation is 5 – 3 resulting in 2 gummy bears. We build on the comparison conceptualization for a concrete way to think about subtraction with integers on the real line. We start by locating integers on the line and note that when comparing two integers, there is a directional or signed distance between them, e.g. when comparing 5 and 3 we can think “5 is two units to the right of 3,” (5 – 3 is 2), or “3 is two units to the left of 5,” (3 – 5 is –2). Another example, when comparing 5 and –3 and think, “5 is eight units to the right of –3,” (5 – (–3) is 8), but “–3 is eight units to the left of 5,” ((–3) – 5 is –8.) In section 2.1e, students will examine subtraction exercises and notice that a – b can be written as a + (–b) and that a – (–b) can be written as a + b. This is an essential understanding and one on which students can build fluency for working with integers.

Adding and subtracting integers can cause students a great deal of trouble particularly when students first confront exercises that have both addition and subtraction with integers. For example, in problems like –5 – 7 students are often unsure if they should treat the “7” as negative or positive integer and if they should add or subtract. For this reason, it is extremely helpful to make it a norm from the beginning of this chapter that students circle the operation before they preform it.

Rules for operating with integers come from extending rules of arithmetic. Students should understand that arithmetic with negative numbers is consistent with arithmetic with positive numbers. Students need to remember that subtraction in the set of integers is neither commutative nor associative. In other words, in general, a – b ≠ b – a and (a – b) – c ≠ a – (b – c). However, a – b = a + (–b) = (–b) + a.

Concepts and Skills to be Mastered (from standards)

By the end of this section, students should be able to:
1. Use a concrete model (chips/tiles or number line) to add integers.
2. Use a concrete model (chips/tiles or number line) to subtract integers.
3. Find the sums of integers accurately without a model.
4. Find the differences of integers accurately without a model.
5. Solve contextual problems involving adding or subtracting integers.
2.1a Class Activity: Additive Inverse (Zero Pairs) in Context and Chip/Tile Model

An *additive inverse* is an important mathematical idea that we will begin to informally explore in this activity. For now, we will use the informal term “zero pair” to refer to two things that are “opposite” or “undo each other.” The sum of the two elements of a zero pair is zero. We see zero pairs in many contexts. For example, an atom with 5 protons and 5 electrons has a neutral charge, or a net charge of zero. Use the idea of “zero pairs” to complete the worksheet.

<table>
<thead>
<tr>
<th>Context</th>
<th>Model/Picture</th>
<th>Net Result in Words</th>
<th>How Many Zero Pairs?</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. A Hydrogen atom has one proton and one electron.</td>
<td>![Zero Pair Diagram]</td>
<td>The atom has a neutral charge.</td>
<td>1</td>
</tr>
<tr>
<td>2. I took 4 steps forward and 3 steps back.</td>
<td>![Forward and Back Steps]</td>
<td>I am one step ahead of where I started.</td>
<td>3</td>
</tr>
<tr>
<td>3. I got a check in the mail for $1,000,000, but then I got a bill that says I owe $1,000,000.</td>
<td>+$1,000,000 −$1,000,000</td>
<td>I will have no money.</td>
<td>1,000,000</td>
</tr>
<tr>
<td>4. I ate one candy bar with 200 calories. Then I ate four apples with 50 calories each.</td>
<td>![Candy Bar and Apples]</td>
<td>I gained 400 calories. Healthy calories do not “undo” candy calories.</td>
<td>None</td>
</tr>
<tr>
<td>5. Joe found four quarters, but he had a hole in his pocket and lost one quarter.</td>
<td>![Quarters and Hole]</td>
<td>Joe gained three quarters.</td>
<td>1</td>
</tr>
<tr>
<td>6. Lisa earned $8 then spent $6.</td>
<td>![Student Models Similar]</td>
<td>Lisa gained $2</td>
<td>6</td>
</tr>
<tr>
<td>7. George gained ten pounds, but then he went on a diet and lost twelve pounds.</td>
<td>![Student Models Similar]</td>
<td>George weighs 2 pounds less than at the start.</td>
<td>10</td>
</tr>
<tr>
<td>8. John took $15 out of his bank account then deposited $10.</td>
<td>![Student Models Similar]</td>
<td>John’s account has $5 less than at the start.</td>
<td>10</td>
</tr>
</tbody>
</table>

The terms “additive inverse” and “zero pairs” can be used interchangeably. Move to using “additive inverse.”
For the following exercises, use the key below:

\[ \square = 1 \]

\[ \blacksquare = -1 \]

In pairs, look at the following models. Make a conjecture for what you think the model represents. Construct an argument to support your claim.

<table>
<thead>
<tr>
<th>Exercise</th>
<th>Model</th>
<th>Argument</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.</td>
<td><img src="image1.png" alt="Model" /></td>
<td>This model represents: 8 &lt;br&gt;Argument: 8 positive squares</td>
</tr>
<tr>
<td>10.</td>
<td><img src="image2.png" alt="Model" /></td>
<td>This model represents: –8 &lt;br&gt;Argument: 8 negative squares</td>
</tr>
<tr>
<td>11.</td>
<td><img src="image3.png" alt="Model" /></td>
<td>This model represents: 0 &lt;br&gt;Argument: a zero pair</td>
</tr>
<tr>
<td>12.</td>
<td><img src="image4.png" alt="Model" /></td>
<td>This model represents: 1 &lt;br&gt;Argument: 2 zero pairs. 1 positive square</td>
</tr>
<tr>
<td>13.</td>
<td><img src="image5.png" alt="Model" /></td>
<td>This model represents: –1 &lt;br&gt;Argument: 2 zero pairs. A negative square</td>
</tr>
<tr>
<td>14.</td>
<td><img src="image6.png" alt="Model" /></td>
<td>This model represents: –4 &lt;br&gt;Argument: 1 zero pair, 4 negative squares</td>
</tr>
</tbody>
</table>

15. In general, explain how you can use a model to represent positive and negative numbers: <br>**Answers will vary.**
Model the following expressions using integer chips/tiles. Draw pictures of your models using the above key to show what you did, then explain in words how you arrived at your answer.

16. Represent $-5$ with chips/tiles. Draw your representation in the space below:

![Representation of -5 with chips/tiles]

Explain your representation. Can you represent $-5$ in another way? Explain.

I have shown 5 gray (negative) tiles. I can also show 6 gray (negative) tiles and 1 white (positive) tile.

![Alternative representation of -5 with chips/tiles]

There are a variety of ways students might do this. All representations will have five negative chips and then a variety of zero pairs of chips. You might point out that no matter how many times we add zero to “something”, we always just get the “something” back.

17. Represent 7 with chips/tiles. Draw your representation in the space below:

![Representation of 7 with chips/tiles]

Explain your representation. Can you represent 7 in another way? Explain.

I have shown 7 white (positive) tiles. I could have shown 8 white and 1 gray.

18. Explain what it means to “add” numbers:

Addition means to combine or join. Help students notice that we combine “like” things and that it’s useful to write things in the most concise manner possible.

For #19 – 27, circle the operation, draw a representation, and then find the sum, explaining your reasoning.

19. Represent $5 + 6$ with chips/tiles. Draw your representation and its sum in the space below:

<table>
<thead>
<tr>
<th>Representation:</th>
<th>Explanation:</th>
</tr>
</thead>
<tbody>
<tr>
<td>![Representation of 5 + 6 with chips/tiles]</td>
<td>There are a total of 11 positive chips, so I have positive 11.</td>
</tr>
</tbody>
</table>

Throughout these lessons you will be working with “zero pair.” Note that this is related to the idea of an additive identity.
20. Represent \((-4) + 4\) with chips/tiles. Draw your representation in the space below:

<table>
<thead>
<tr>
<th>Representation:</th>
<th>Explanation:</th>
</tr>
</thead>
<tbody>
<tr>
<td>![Representation Image]</td>
<td>There are four zero pairs and nothing else. So I have 0.</td>
</tr>
</tbody>
</table>

21. Represent \(-4 + 3\) with chips/tiles. Draw your representation in the space below:

<table>
<thead>
<tr>
<th>Representation:</th>
<th>Explanation:</th>
</tr>
</thead>
<tbody>
<tr>
<td>![Representation Image]</td>
<td>There are three zero pair and then one negative tile left so I have (-1).</td>
</tr>
</tbody>
</table>

22. Represent \(8 + (-6)\) with chips/tiles. Draw your representation in the space below:

<table>
<thead>
<tr>
<th>Representation:</th>
<th>Explanation:</th>
</tr>
</thead>
<tbody>
<tr>
<td>![Representation Image]</td>
<td>There are six zero pairs and then two positive tiles left so I have 2.</td>
</tr>
</tbody>
</table>

23. Why do you think \#20 and \#22 used “( )” around one of the numbers, but \#21 did not?

Parentheses can lend clarity.

24. Represent \(-5 + (-8)\) with chips/tiles. Draw your representation and its sum in the space below:

<table>
<thead>
<tr>
<th>Representation:</th>
<th>Explanation:</th>
</tr>
</thead>
<tbody>
<tr>
<td>![Representation Image]</td>
<td>There are five negative tiles and eight negative tiles for a total of thirteen negative tiles.</td>
</tr>
</tbody>
</table>
25. Represent \((-3) + (8)\) with chips/tiles. Draw your representation and its sum in the space below:

<table>
<thead>
<tr>
<th>Representation:</th>
<th>Explanation:</th>
</tr>
</thead>
<tbody>
<tr>
<td>5</td>
<td>There are three zero pairs and five positive tiles left.</td>
</tr>
</tbody>
</table>

26. Represent \(4 + (-2)\) with chips/tiles. Draw your representation and its sum in the space below:

<table>
<thead>
<tr>
<th>Representation:</th>
<th>Explanation:</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>There are two zero pairs and two positive tiles left.</td>
</tr>
</tbody>
</table>

27. Represent \((-5) + (-3)\) with chips/tiles. Draw your representation and its sum in the space below:

<table>
<thead>
<tr>
<th>Representation:</th>
<th>Explanation:</th>
</tr>
</thead>
<tbody>
<tr>
<td>(-8)</td>
<td>There are five negative tiles and three negative tiles for a total of eight negative tiles.</td>
</tr>
</tbody>
</table>

For positive numbers convention is to NOT write a sign in front of the number, however for negative numbers we use a “–” to signify that the number is located on the opposite side of the 0 on the real line.
## 2.1a Homework: Additive Inverse (Zero Pairs) in Context and Chip/Tile Model

Fill in the table below.

<table>
<thead>
<tr>
<th>Context</th>
<th>Model/Picture</th>
<th>Net Result in Words</th>
<th>How Many Zero Pairs?</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. The Helium atom had two protons and two electrons.</td>
<td><img src="image" alt="Model" /></td>
<td>0</td>
<td>2</td>
</tr>
<tr>
<td>2. The treasure map said to take ten steps north, then eight steps south.</td>
<td><img src="image" alt="Model" /></td>
<td>2 steps north</td>
<td></td>
</tr>
<tr>
<td>3. Jen earned $6 working in the garden, and then she spent $5 on a toy.</td>
<td><img src="image" alt="Model" /></td>
<td>$5</td>
<td></td>
</tr>
<tr>
<td>4. The elevator started on the 8th floor, went up five floors, and then went down two floors.</td>
<td></td>
<td>11th floor</td>
<td>2</td>
</tr>
<tr>
<td>5. Seven students were added to Ms. Romero’s class and then four students dropped it.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>6. The temperature fell twelve degrees between midnight and 6 a.m. The temperature rose twelve degrees between 6 a.m. and 8 a.m.</td>
<td></td>
<td>Same temperature</td>
<td>12</td>
</tr>
<tr>
<td>7. The home team scored a goal, which was answered with a goal from the visiting team.</td>
<td></td>
<td></td>
<td>1</td>
</tr>
<tr>
<td>8. The football team gained seven yards on the first down, and lost nine yards on the second down.</td>
<td><img src="image" alt="Model" /></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

<tr>
<td>13.</td>
<td>−4 + (−2)</td>
<td><img src="image5.png" alt="Chip Model" /></td>
<td><img src="image6.png" alt="Chip Model" /></td>
</tr>
<tr>
<td>15.</td>
<td>7 + (−6)</td>
<td><img src="image7.png" alt="Chip Model" /></td>
<td><img src="image8.png" alt="Chip Model" /></td>
</tr>
<tr>
<td>10.</td>
<td>−3 + 8</td>
<td><img src="image9.png" alt="Chip Model" /></td>
<td><img src="image10.png" alt="Chip Model" /></td>
</tr>
<tr>
<td>12.</td>
<td>−5 + 8</td>
<td><img src="image11.png" alt="Chip Model" /></td>
<td><img src="image12.png" alt="Chip Model" /></td>
</tr>
<tr>
<td>14.</td>
<td>−6 + (−3)</td>
<td><img src="image13.png" alt="Chip Model" /></td>
<td><img src="image14.png" alt="Chip Model" /></td>
</tr>
<tr>
<td>16.</td>
<td>4 + (−8)</td>
<td><img src="image15.png" alt="Chip Model" /></td>
<td><img src="image16.png" alt="Chip Model" /></td>
</tr>
</tbody>
</table>

**Extension Questions:**

Suppose $a + b = c$ and $c < 0$, give an example when this might happen.

What do you know about $a$ and $b$ relative to each other for $c < 0$? If $a$ and $b$ are negative, $c < 0$. If only one is negative, the one that’s negative must have an absolute value greater than the one that’s positive.
Spiral Review

1. Order the following rational numbers from least to greatest. \(\frac{27}{3}, 6.5, \frac{18}{3}, 0.99, 0.99,\)
   \[0.99, \frac{18}{3}, 6.5, \frac{27}{3}\]

2. What is the opposite of \(-15\)?
   \(+15 \text{ or } 15\)

3. What is 40% of 220? Use a bar model. \(88\)

4. Without using a calculator, determine which fraction is bigger in each pair. Justify your answer with a picture and words.
   a. \(\frac{1}{3} \text{ or } \frac{1}{2}\)
      \[\text{1 piece out of a pie cut into 2 will be bigger than 1 piece out of a pie cut into 3 pieces}\]
   b. \(\frac{3}{7} \text{ or } \frac{3}{5}\)

5. Solve using a bar model. \(\frac{1}{2} + \frac{3}{7} = \frac{13}{14}\)
2.1b Class Activity: Add Integers Using a Number Line

Explore:
Answer each of the following questions. Using pictures and words, explain how you arrived at your answer. Models will vary.
1. An osprey flies off the ground and reaches 35 feet above a river when he sees a trout. He then dives 37 feet down to get the trout. How many feet below the water does he end up?

2 feet below the surface

2. Zach’s football team moves the football 35 yards forward on the first down. On the next down, they lose 12 yards. On the down after that they go forward 8 yards. How many yards from the starting point did they move the football in the three downs?

31 yards.

3. You walk 3 miles from your house to the store. At the store you meet up with a friend and walk with her 1 mile back towards your house. How far are you from your house now?

2 miles from your house

4. You ride your bike 12 miles and then get a flat tire! You turn around and walk the bike 4 miles before you mom is able to pick you up. How far are you from the house when your mom picks you up?

8 miles
**Review:**

Place each of the following integers on the number line below. Label each point:

5. \(A = 4\)  \(B = -4\)  \(C = -15\)  \(D = 7\)  \(E = 18\)  \(F = -19\)

![Number Line Image]

6. \(A = -20\)  \(B = -17\)  \(C = 7\)  \(D = 13\)  \(E = -6\)  \(F = 19\)

![Number Line Image]

7. How did you locate 7 on the number line?
   7 is seven units RIGHT of 0 (or 7 units UP from 0).

8. How did you locate \(-15\) on the number line?
   \(-15\) is 15 units LEFT of 0

9. In general, how do you locate a positive or negative number on a number line? Positive numbers are to the right of 0 (up from 0) and negative numbers are to the left of 0 (below 0).

10. Brainstorm similarities and differences between a chip model and number line model for representing integers.
    Answers will vary, students will note many things. Highlight the zero pairs in both representations.
Previously in this section, you used a chip model for addition of integers. In this activity you will explore a number line model of addition of integers. Model each of the following with both a number line and chips. Start by circling the operation.

**Example:** \(-5 + 4\) Have students begin at zero, then draw the arrow in the appropriate direction to model the first number in the equation, then move on from there for the second number to arrive at the solution. You may also think about starting at the first number \((-5)\) and from there add the next number, in this case, 4.

<table>
<thead>
<tr>
<th>Number line:</th>
<th>Chips</th>
</tr>
</thead>
<tbody>
<tr>
<td>–5 + 4 = –1</td>
<td>–5 + 4 = –1</td>
</tr>
</tbody>
</table>

11. Model 7 + −3 on a number line and with chips: 4

<table>
<thead>
<tr>
<th>Number line</th>
<th>Chips</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

12. Explain how the number line and chip models are related: You’re moving students towards understanding, either with the chip or the number line model, that something like 7 + −3 = (4 + 3) + −3 = 4 + (3 + −3) = 4 + (0) = 4. Students will likely not be ready to write this out, but they should be ready to start to explain it. Notice that you’re using properties of arithmetic.
Circle the operation you are going to perform. Find the sum using a number line for the following addition exercises.
Note that the difference between an operation (add, subtract, multiply, or divide) and a positive or negative number; e.g. 6(−3) is not the same and 6 − 3.

13. 6 + (−3) 3

14. −3 + (−9) −12

15. −4 + (−4) −8

Point out that there is NO “overlap” in #14 and #15, but in the next several problems there is. In #17, students may note: −9 + 8 = (−1 + −8) + 8 = −1 + (−8 + 8) = −1 + (0) = −1.

15. 6 + (−6) 0

16. −9 + 8 −1

17. 20 + (−8) 12
18. \(-12 + 14\) 2

19. \(9 + (-25)\) -16

20. \(12 + (-9)\) 3

21. \(-8 + (-7)\) -15

22. \(-7 + (-7)\) -14

23. \(13 + (-13)\) 0
Below are the questions from the exploration at the beginning of Class Activity 2.1b. For each context, do the following:
   a. use a number line to model the problem situation
   b. answer the question in the context
   c. write an addition equation to show the sum
   d. explain how the model is related to how you found the answer when you answered the question

24. An osprey flies off the ground and reaches 35 feet above a river when he sees a trout. He then dives 37 feet down to get the trout. How many feet below the water does he end up?

   a.  
   b. The osprey is 2 feet below the surface of the water.
   c. $35 - 37 = -2$ or $35 + (-37) = -2$
   d. Example: The model shows that I went from 0 up to 35 on the number line and then I went down 37 units from 35. This put me at $-2$. This represents the 2 feet below the surface when I found my answer.

25. Zach’s football team moves the football 35 yards forward on the first down. On the next down, they lose 12 yards. On the down after that they go forward 8 yards. How many yards from the starting point did they move the football in the three downs?

   a.  
   b. Zach’s team is 31 yards farther down the field than when they started.
   c. $35 + (-12) + 8 = 31$
   d. Answers will vary.
26. You walk 3 miles from your house to the store. At the store you meet up with a friend and walk with her 2 mile back towards your house. How far are you from your house now?

a. 

b. I am 1 mile away from my house now.

c. \(3 - 2 = 1\) or \(3 + (-2) = 1\)

d. Answers will vary.

27. You ride your bike 12 miles and then get a flat tire! You turn around and walk the bike 8 miles before your mom is able to pick you up. How far are you from the house when your mom picks you up?

a. 

b. I am 4 miles away from my house.

c. \(12 - 8 = 4\) or \(12 + (-8) = 4\)

d. Answers will vary.

28. For the model below, write a numeric expression and then create a context.

\[15 + (-20)\]

Contexts will vary.
2.1b Homework: Add Integers Using a Number Line

Circle the operation. Model the expressions using a number line and write the answer. The first one is done for you.

1. \(12 + 5\) \(\quad\) \(17\)

2. \(-7 + 5\)

3. \(9 + (-9)\) \(\quad\) \(0\)

4. \(-11 + (-5)\) \(\quad\) \(-\)

5. \(8 + (-13)\) \(\quad\) \(-\)

6. \(-15 + (-4)\) \(\quad\) \(-19\)

7. \(11 + 9\)

8. \(7 + (-16)\)

a. Write an addition expression to show how much money you owe. \((-25) + 13\)

A numerical expression is a translation of the situation in words to a situation in numbers and/or symbols.

b. Label the number line and model the expression. Circle the answer to the expression.

\(-12\)

![Number line with -12 circled]

c. Explain your expression and model.

Answers will vary.

10. Write a context for the following the addition expression: \(-15 + 25\)

a. Model the context using the number line.

![Number line with arrows indicating movement]

11. Write a context and expression for the model; when state the answer.

![Number line with arrows indicating movement]

**Spiral Review**

1. Using bar notation, show \(4 \frac{1}{4} - 2 \frac{1}{2}\).

   \[
   1 \frac{3}{4} \quad \begin{array}{cccc}
   & & & \\ & & & \\ & & & \\ \ & & & \\ \ & & & \\ \ & & & \\ \ & & & \\ \ & & & \\ \ & & & \end{array}
   \begin{array}{cccc}
   & & & \\ & & & \\ & & & \\ \ & & & \\ \ & & & \\ \ & & & \\ \ & & & \\ \ & & & \\ \ & & & \end{array}
   \begin{array}{cccc}
   & & & \\ & & & \\ & & & \\ \ & & & \\ \ & & & \\ \ & & & \\ \ & & & \\ \ & & & \\ \ & & & \end{array}
   \begin{array}{cccc}
   & & & \\ & & & \\ & & & \\ \ & & & \\ \ & & & \\ \ & & & \\ \ & & & \\ \ & & & \end{array}
   \begin{array}{cccc}
   & & & \\ & & & \\ & & & \\ \ & & & \\ \ & & & \\ \ & & & \\ \ & & & \\ \ & & & \end{array}
   \]

2. Place the fractions on the number line below.

   \[
   \begin{array}{llll}
   \frac{6}{5} & \frac{3}{10} & \frac{1}{5} & \frac{3}{2}
   \end{array}
   \]

3. Write \(\frac{1}{3}\) as a percent and decimal. \(33.\overline{3}\%\), \(0.\overline{3}\)

4. A spinner contains three letters of the alphabet.

   a. How many outcomes are possible if the spinner is spun three times? \(27\)

   b. List all of the outcomes for spinning three times.
   \[
   \text{KKK, KKV, KKH, KVK, KVV, KHV, KHK, KHV, VKK, VKV, VKH, VVK, VVV, VVH, VHK, VHV, VHH, HHH,}
   \]

   c. What is the probability of getting exactly one H in three spins?
   \[
   \frac{12}{27} = \frac{4}{9} = 0.\overline{4} = 44.\overline{4}\%\]
## 2.1c Class Activity: Model Integer Addition with Chips/Tiles and Number Lines

Circle the operation you are going to perform. Model each integer addition exercise with chips/tiles (on the left) and with a number line (on the right). Record the sum.

<table>
<thead>
<tr>
<th>Chips/Tiles</th>
<th>Number Line</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image1" alt="Chips/Tiles" /></td>
<td><img src="image2" alt="Number Line" /></td>
</tr>
<tr>
<td><strong>1.</strong> 8 + 9</td>
<td>8 + 9</td>
</tr>
<tr>
<td><img src="image3" alt="Chips/Tiles" /></td>
<td><img src="image4" alt="Number Line" /></td>
</tr>
<tr>
<td><strong>2.</strong> 7 + (−2)</td>
<td>7 + (−2)</td>
</tr>
<tr>
<td><img src="image5" alt="Chips/Tiles" /></td>
<td><img src="image6" alt="Number Line" /></td>
</tr>
<tr>
<td><strong>3.</strong> −5 + 6</td>
<td>−5 + 6</td>
</tr>
<tr>
<td><img src="image7" alt="Chips/Tiles" /></td>
<td><img src="image8" alt="Number Line" /></td>
</tr>
<tr>
<td><strong>4.</strong> −9 + 4</td>
<td>−9 + 4</td>
</tr>
<tr>
<td><img src="image9" alt="Chips/Tiles" /></td>
<td><img src="image10" alt="Number Line" /></td>
</tr>
<tr>
<td><strong>5.</strong> −6 + (−8)</td>
<td>−6 + (−8)</td>
</tr>
<tr>
<td><img src="image11" alt="Chips/Tiles" /></td>
<td><img src="image12" alt="Number Line" /></td>
</tr>
</tbody>
</table>

### 6. How are the models related? What do you notice about “zero pairs?”

Students should explain that: $-9 + 4 = (-5 - 4) + 4 = -5 + (4 + -4) = -5 + (0) = -5$

### 7. Which model do you prefer and why? Students may use either model for thinking about addition of integers. However, the core explicitly states students must understand the number line.
Circle the operation you are going to perform. Use a model to find the sum for each problem # 8 - 15.

8. 5 + (–4)  1

5.  –5 + 9  4

6.  –2 + (–3)  –5

7.  0 + (–9)  –9

8.  –1 + (–9)  –10

9.  –1 + 1  0

10.  –2 + 6  4

11.  –9 + (–7)  –16

Circle the operation you are going to perform. Find the sum for each. Justify your answer.

12. 12 + (–9)  3

13.  –4 + (–7 )  –11

14.  –3 + 8  5

15.  10 + (–11)  –1

16.  7 + (–12)  –5

17.  –4 + (–9)  –13

18.  –5 + 9  4

19.  13 + 8  21

While students may not use models here, they should be able to justify their answers: 12 + (–9) = (3 + (9)) + (–9) = 3 + (9 + (–9)) = 3 + (0) = 3. Students should write a justification for some of these—either words, or as above.
2.1c Homework: Compare Chips/Tiles and Number Line Models for Addition of Integers

Circle the operation you are going to perform. Model each integer addition problem with chips/tiles and with a number line. Record the sum.

<table>
<thead>
<tr>
<th>Chips/Tiles</th>
<th>Number Line</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>1. 5 + 8</strong></td>
<td><img src="image1" alt="Number Line" /></td>
</tr>
<tr>
<td><strong>13</strong></td>
<td><img src="image2" alt="Number Line" /></td>
</tr>
<tr>
<td><strong>2. −4 + (−3)</strong></td>
<td><img src="image3" alt="Number Line" /></td>
</tr>
<tr>
<td><strong>3. 7 + (−9)</strong></td>

Spiral Review

1. Order the following fractions from least to greatest.

\[
\frac{2}{3} \quad \frac{3}{10} \quad \frac{1}{2} \quad \frac{3}{2} \quad \frac{4}{3}
\]

\[
\frac{3}{10} \quad \frac{1}{2} \quad \frac{2}{3} \quad \frac{4}{3} \quad \frac{3}{2}
\]

2. Use a number line to solve \(27 - 7\).

\[
\begin{align*}
\text{"Take-away" model} & \quad \text{OR} \\
\text{"Difference" model}
\end{align*}
\]

3. Write \(\frac{27}{4}\) as a mixed number. Model to solidify understanding.

\[
6\frac{3}{4}
\]

4. Write the fraction equivalent (in simplest form) for each decimal.
   a. 0.27 \(\frac{27}{100}\)  
   b. 0.35 \(\frac{7}{20}\)  
   c. 0.4 \(\frac{2}{5}\)  
   d. 0.125 \(\frac{1}{8}\)

5. Write 0.452 as a percent.

\(45.2\%\)
2.1d Class Activity: Number Line Model for Subtraction

Plot each pair of points on the same number line.

1. 3 and 8

2. \(-4\) and 3

3. \(-1\) and \(-7\)

4. Circle the operation. Write a context for \(8 - 3\) and then state the difference. Stress that you are subtracting. Students will likely offer a “take away” context; e.g. “Maggie has 8 jelly beans. If Hugo eats 3 of her jelly beans, how many jelly beans will she have left?” This is a valid context, but push students to come up with a “comparison” context e.g. “Maggie has 8 jelly beans and Hugo has 3 jelly beans, how many more jelly beans does Maggie have than Hugo?” Point out that for both contexts the operation is subtraction. We will be using comparison in this section.

5. Circle the operation. Make a conjecture for \(3 - 8\). Ask students if this difference will be the same as \(8 - 3\), why/why not? Ask student to try to use the context from #4 for \(3 - 8\), e.g. “Maggie has 8 jelly beans and Hugo has 3 jelly beans, how does the number of jelly beans Hugo has compare to that of Maggie?” Refer to the number line. Help students see that the difference of both \(8 - 3\) and \(3 - 8\) have something to do with “5” because the distance between the two numbers is 5 units. The direction of the distance for \(3 - 8\) is opposite to that of \(8 - 3\). Thus the answers are opposite.

6. Circle the operation. Make a conjecture for the two differences below. Refer to the # 2 to help you.

\[
3 - (-4) \quad 7 \quad (-4) - 3 \quad -7
\]

Help students see that the distance between 3 and \(-4\) is seven units. If we start at 3 and compare \(-4\), we see that 3 (the start) is seven units to the right of \(-4\), so the difference is positive 7. However, if we start at \(-4\), and compare 3, while the distance is still 7 units, \(-4\) (the start) is to the LEFT of 3, so the difference is \(-7\).

7. Circle the operation. Make a conjecture for the following two differences below. Refer to #3 to help you.

\[
-1 - (-7) \quad 6 \quad (-7) - (-1) \quad -6
\]
Subtraction can be thought of as the “signed distance” or “directional distance” between two points.

a. Model 7 – 2 on the number line.

b. Model 2 – 7 on the number line.

***The “s” is where we start and the “f” is where we finish. The arrow is below the start to note if the start is bigger or smaller than the finish. For 7 – 2, the start is bigger (to the right of) the finish, so the answer is (positive) 5. For 2 – 7, the start is smaller, to the left of the finish, so the answer is –5.

For both a and b the difference is |5|. How can you use a number line to know if the difference is represented with a positive or negative integer?

Students studied absolute value in 6th grade. In 2.1e (the next class activity) you will formalize \(a - b\) is the same as \(a + (-b)\) and \(a - (-b)\) is the same as \(a + b\). The purpose of circling this operation is to focus students on what they are doing.

8. Circle the operation. Model 8 – 7 on the number line.

With the subtraction circled, emphasize that we can think, “How far apart are 8 and 7?” 8 is the start, it’s one unit from 7 and it’s bigger than 7, so the difference is 1.”

9. Circle the operation. Model 8 – (–7) on the number line. Circle the subtraction. Say, “8 is how far from –7? It is 15 units right. Thus the difference is 15.”

With the subtraction circled, emphasize that we can think, “how far apart are 8 and –7?” 8 is the start, it’s 15 units away from –7 and it’s bigger than (to the right of) –7, so the difference is 15.”

10. Explain why the answers for the two problems above are so different.

#8 we are comparing 8 and 7, they are only one unit apart and 8 is to the right of 7. For #9, we are comparing 8 and –7. These two numbers are 15 units apart and 8 is to the right of –7 so the difference is 15.

11. What is –8 – 7? Explain. –15. Emphasize that circling the operation here makes it clear we are subtracting (finding the directional distance). Talk about this relative to #10. –8 is fifteen units to the left of 7, thus the difference is –15.
Circle the operation. Locate each value in the difference expression on the number line and compute the difference.

12. \(-3 - (-10)\) 7
13. \(-3 - 10\) 13

14. \(3 - 10\) 7
15. \(14 - 20\) 6

16. \(6 - (-16)\) 22
17. \(-15 - (-25)\) 10

Circle the operation. Draw a number line, locate each value in the difference expression on the number line, and compute the difference.

18. \(-14 - 1\) 15
19. \(9 - 15\) 6
20. \(14 - 18\) 4
21. \(-12 - (-9)\) 3

22. \(-13 - (-13)\) 0
23. \(13 - 13\) 0
24. \(15 - (-8)\) 23
25. \(-10 - (-6)\) 4
2.1d Homework: Number Line Model for Subtraction

Circle the operation. The model is provided. Find the difference. The first one is done for you.

1. $4 - 17$  Answer: $-13$

2. $5 - (-10)$

3. $-7 - 6$  $-13$

4. $-8 - (-9)$  $1$

5. $9 - 4$

Circle the operation. Draw your own number line. Find the difference for each.

6. $7 - (-3)$  $10$

7. $8 - (-4)$

8. $5 - 12$  $-7$

9. $6 - 18$

10. $14 - 3$  $11$

11. $21 - 5$

12. $-13 - 17$  $-30$

13. $-8 - 3$

14. $-9 - (-4)$  $-5$

15. $-2 - (-6)$
Spiral Review

1. Use the chip model to find $-12 + 5$.

2. What percent of 80 is 60? 75%

3. Camilla earned $160 over the summer. If she put 80% of her earnings into her savings account how much money did she have left over?

4. Order the numbers from least to greatest.

   $\frac{17}{7}, 2.7, 2.15, 2.105$  $2.105, 2.15, \frac{17}{7}, 2.7$
2.1e Class Activity: More Subtraction with Integers

1 – 20 Addition and Subtraction exercises. CIRCLE the operation. State the sum or difference.

</tbody>
</table>

Look back at the previous exercises. Which is easier to think about, addition or subtraction? What pattern do you notice with the subtraction exercises?

Students will likely be more comfortable with addition. Ask: is there any way to think about subtraction as addition? TAKE TIME here. Gradually move to: $a - b = a + (-b)$ or $a - (-b) = a + b$. You might want to examine with students numbers $5, 9, 12,$ and $14$ as they begin to look for patterns. Have students write the pattern they see with examples, e.g. $6 - 13 = 6 + (-13)$ or $8 - (-3) = 8 + 3$. 

#
Write an equivalent addition expression for each subtraction expression and then simplify the expression.

<table>
<thead>
<tr>
<th>Subtraction Expression</th>
<th>Addition Expression</th>
<th>Simplified</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: 3 – 5</td>
<td>3 + (–5)</td>
<td>–2</td>
</tr>
<tr>
<td>21. –2 – 6</td>
<td>–2 + (–6)</td>
<td>–8</td>
</tr>
<tr>
<td>22. 9 – 14</td>
<td>9 + (–14)</td>
<td>–5</td>
</tr>
<tr>
<td>23. 7 – (–4)</td>
<td>7 + 4</td>
<td>11</td>
</tr>
<tr>
<td>24. –10 – (–7)</td>
<td>–10 + 7</td>
<td>–3</td>
</tr>
<tr>
<td>25. 12 – 8</td>
<td>12 + (–8)</td>
<td>4</td>
</tr>
<tr>
<td>26. –5 – 3</td>
<td></td>
<td></td>
</tr>
<tr>
<td>27. –1 – (–15)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>28. 6 – (–8)</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Write each term as two equivalent expressions both involving subtraction.
**Example:** –4; –7 – (–3) or 3 – 7

<table>
<thead>
<tr>
<th>29. –2</th>
<th>30. –4</th>
<th>31. –1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Answers will vary. For example: –5 – (–3) or 3 – 5</td>
<td>–7 – (–3) or 3 – 7</td>
<td></td>
</tr>
</tbody>
</table>

For these problems we want students to think about directional distance. They should identify two numbers that are 2 units apart and then write a difference expression so that the first term is to the left of the second: 2 – 4; –2 – 0; –7 – (–9).

Write each quantity below as two equivalent numeric expressions, one involving addition and the other involving subtraction. **Example:** –3; –3 can be written as 4 – 7 or 4 + (–7); 5 can be written as 8 – 3 or 8 + (–3)

<table>
<thead>
<tr>
<th>32. 4</th>
<th>33. –2</th>
<th>34. –4</th>
</tr>
</thead>
<tbody>
<tr>
<td>Answers will vary. Example: 6 – 2 or 6 + (–2)</td>
<td>2 – 4 or 2 + (–4)</td>
<td></td>
</tr>
</tbody>
</table>

For these problems we want students to think about how directional distances is related to sums.

35. How will you determine if “–“ means subtract or negative in a numeric expression? Students will have a variety of responses. Help them notice that subtraction expressions can be rewritten as addition expressions. If students recognize they are working with subtraction (again emphasize the importance of circling the operation), they can continue to simplify with subtraction OR they might rewrite the difference expression as a sum expression: \( a - b = a + (–b) \) or \( a - (–b) = a + b \).
Answer the two questions below. Draw a model to justify your answer.

36. Louis picks up a football that has been fumbled by his quarter back 12 yards behind the line of scrimmage. He runs forward 15 yards before he is tackled. Where is he relative to the line of scrimmage?

\[ -12 + 15 \text{ or } 15 - 12 \]

He is 3 yards ahead of the line of scrimmage

37. Leah owes her friend seven dollars. Leah’s friend forgives three dollars of her debt. How much does Leah now owe her friend? Forgiving a debt is like removing a debt. This will likely be difficult wording for students. However, they will likely have an intuitive understanding that Leah now only owes 4 dollars.

\[ -7 - (-3) \text{ or } -7 + 3 \text{ or } 3 - (-7) \]

Leah owes her friend 4 dollars; e.g. \(-4\)

Circle the operation. Find the indicated sum or difference. Draw a number line or chip/tile model when necessary. You may change the expression to addition when applicable.

Spiral Review

1. What is 80% of 520?
   416

2. Suppose you were to roll a fair 6-sided number cube once, then flip a coin. List all the possible outcomes.

   1H, 2H, 3H, 4H, 5H, 6H, 1T, 2T, 3T, 4T, 5T, 6T

Using the information in #2, answer the questions below. Write all probabilities as fractions, decimals and percentages.

3. What is the probability of getting a 2 and heads from the experiment above?
   \[ \frac{1}{12} = 0.08\overline{3} = 8.\overline{3}\% \]

4. What is the probability that you would roll an even number and flip heads?
   \[ \frac{3}{12} = \frac{1}{4} = 0.25 = 25\% \]

5. What is the probability that you would roll an even number or flip heads?
   \[ \frac{9}{12} = \frac{3}{4} = 0.75 = 75\% \]
2.1f Class Activity: Applying Integer Operations

Use a chip or number line model to solve each of the following. Write a numerical expression that models your solution and then write a complete sentence stating your answer.

Student models and expressions will vary.

1. At the Masters Golf Tournament, Tiger Woods’ score is –3 and Phil Mickelson’s score is –5. Who is in the lead and by how many shots? (Note: In golf, the lower score wins.)

\[-5 - (-3)\]

Phil Mickelson leads by 2 shots.

2. Steve found a treasure map that said to take ten steps north, then ten steps south. Where is Steve in relationship to where he started?

\[10 + (-10)\]

Steve is standing where he began.

3. Tom left school and walked 5 blocks east. Charlie left school and walked the same distance west. How far apart did the two friends end up?

\[5 - (-5)\]

Charlie and Tom are 10 blocks apart.

4. Ricardo’s grandmother flew from Buenos Aires, Argentina to Minnesota to visit some friends. When Ricardo’s grandmother left Buenos Aires the temperature was 84°. When she arrived in Minnesota it was –7°. What was the temperature change for Ricardo’s grandmother?

\[84 - (-7)\]

She has experienced a 91° change.

5. The elevator started on the 8th floor, went up 5 floors, and then went down 2 floors. What floor is it on now?

\[8 + 5 - 2\]

The elevator is on the 11th floor.

6. The temperature rose 13°F between noon and 5 p.m. and then fell 7°F from 5 p.m. to 10 p.m. If the temperature at noon is 75°F, what would the temperature be at 10 p.m.?

\[75 + 13 - 7\]

At 10 p.m. the temperature is 81°.

7. Paula was standing on top of a cliff 35 feet above sea level. She watched her friend Juan jump from the cliff to a depth of 12 feet into the water. How far apart are the two friends?

\[35 - (-12)\]

The two friends are 47 feet apart.

8. The carbon atom had 6 protons and 6 electrons. What is the charge of the atom?

\[6 + (-6)\]

The atom is neutral.

9. The Broncos got possession of the football on their own 20 yard line. They ran for an 8 yard gain. The next play was a 3 yard loss. What is their field position after the two plays?

\[20 + 8 + (-3)\]

The Broncos are on the 25 yard line.

10. Samantha earned $14 for mowing the lawn. She then spent $6 on a new shirt. How much money does she have now?

\[14 - 6\]

Samantha has $8.
**2.1f Homework: Applying Integer Operations**

Use a chip or number line model to solve each of the following. Write a numerical expression that models your solution and then write a complete sentence stating your answer. **Student models will vary.**

1. Chloe has $45 in her bank account. After she went shopping, she looked at her account again and she had –$12. How much did she spend shopping?

   \[ 45 - (-12) \]

   Chloe spent $57.

2. There is a Shaved Ice Shack on 600 South. Both Mary and Lina live on 600 South. Mary lives 5 blocks west of the shack and Lina lives 3 blocks east of it. How far apart do they live?

3. Eva went miniature golfing with Taylor. She shot 4 under par and Taylor shot 2 under par. By how many strokes did Eva beat Taylor?

   \[ -4 - (-2) \]

   Eva won by 2 strokes (-2); in golf you want a lower score.

4. Mitchell owes his mom $18. He’s been helping around the house a lot, so his mom decided to forgive $12 of his debt. How much does he owe now?

   \[ -4 + 12 \]

   Drew Brees’ team has made a gain of 8 yards. This is not enough for a first down.

5. On the first play of a possession Drew Brees was sacked 4 yards behind the line of scrimmage. He then threw a pass for a 12 yard gain. Did the Saints get a first down?

6. Joe had $2. He found a quarter, but he lost a dollar in the vending machine. How much money does he have now?

Write two stories that you could model with positive and negative numbers, then model and solve both. **Answers will vary.**
Spiral Review

1. What is the greatest common factor of 48 and 36?
   12

2. Fill in the equivalent fraction and percent for this decimal:

<table>
<thead>
<tr>
<th>Fraction</th>
<th>Decimal</th>
<th>Percent</th>
</tr>
</thead>
<tbody>
<tr>
<td>( \frac{4}{5} )</td>
<td>0.8</td>
<td>80%</td>
</tr>
</tbody>
</table>

3. Solve each of the following problems with or without a model.
   a) Wanda has 90 bracelets. She sells \( \frac{1}{3} \) of the bracelets. How many bracelets did she sell?
      30

   b) Chad invested $840. If he earned 20% on his investment, how much interest did he earn?
      $168
      How much does he have now?
      $1,008

4. Write a context for the following numeric expression: \( 24(1) + 24\left(\frac{1}{4}\right) \)
2.1f Integer Addition and Subtraction Practice

Solve.

1. $-4 + 9 = \boxed{5}$
2. $8 + (-8) = \boxed{0}$
3. $3 - 4 = \boxed{-1}$
4. $-7 + 8 = \boxed{1}$
5. $4 - 2 = \boxed{2}$
6. $-5 - 13 = \boxed{-18}$
7. $8 + 12 = \boxed{20}$
8. $6 - (-7) = \boxed{13}$
9. $-9 + (-10) = \boxed{-19}$
10. $-6 - (-8) = \boxed{2}$
11. $14 + 18 = \boxed{32}$
12. $-4 - 4 = \boxed{-8}$
13. $-3 + (0 - 9) = \boxed{-12}$
14. $5 - (-6) = \boxed{11}$
15. $4 + (-10) = \boxed{-6}$
16. $6 - 9 = \boxed{-3}$
17. $8 + 3 = \boxed{11}$
18. $10 - 11 = \boxed{-1}$
19. $-12 + 7 = \boxed{-5}$
20. $3 - 8 = \boxed{-5}$
21. $9 - (-11) = \boxed{20}$
22. $8 - (-2) = \boxed{10}$
23. $-7 - 8 = \boxed{-15}$
24. $-8 + 10 = \boxed{2}$
25. $-5 - 21 = \boxed{-26}$
26. $8 + (-10) = \boxed{-2}$
27. $9 + (-1) = \boxed{8}$
28. $8 - (-11) = \boxed{19}$
29. $9 - 6 = \boxed{3}$
30. $7 - (-4) = \boxed{11}$

Sample Problems for Section 2.1

1. Draw a model (chips/tiles or number line) to solve each of the following addition problems.
   a. \( 4 + 7 \)
   b. \( 4 + (-6) \)
   c. \( 1 + (-7) \)
   d. \( -3 + 7 \)

2. Draw a model (chips/tiles or number line) to solve each of the following subtraction problems.
   a. \( 7 - 9 \)
   b. \( -6 - (-3) \)
   c. \( 9 - (-2) \)
   d. \( -4 - 7 \)

3. Find each sum without a model.
   a. \( 3 + 6 \)
   b. \( -7 + (-5) \)
   c. \( 98 + (-1) \)
   d. \( -6 + 7 \)

4. Find each difference without a model.
   a. \( 16 - 29 \)
   b. \( -2 - (-8) \)
   c. \( 5 - (-3) \)
   d. \( -90 - 87 \)

5. Solve each of the following contextual problems involving integers.
   a. Juan’s football team gains 3 yards on one play. On the next play, the quarterback is sacked for a loss of 10 yards. What was the net change in their position?
   b. Kathryn, Loralie, and Madison are playing golf. Kathryn ends with a score of \(-8\). Loralie’s score is \(-4\). Madison scores +5. What is the difference between the scores of Madison and Kathryn?
   c. Nantai is hiking in Death Valley. He starts out at Badwater Basin, the lowest point of Death Valley at an elevation of 282 feet below sea level. He walks northward towards Telescope Peak in the Panamints and reaches an elevation of 2400 feet. How much did his altitude change?
   d. Mr. O’Connor lives in North Dakota. When he leaves for work one wintry morning, the temperature is \(-4^\circ\) C. By the time he comes home, the temperature has increased 25°. What is the temperature when he comes home?
Section 2.2: Multiply and Divide Integers; Represented with Number Line Model

Section Overview:

In Section 2.2 students encounter multiplication with integers. The goal for students in this section is two-fold: 1) fluency with multiplication and division of integers and 2) understanding how multiplication and division with integers is an extension of the rules of arithmetic as learned in previous grades.

This section starts with a review of concepts from elementary mathematics. The mathematical foundation more formally explains multiplication in this manner: “if \( a \) and \( b \) are non-negative numbers, then \( a \cdot b \) is read as ‘\( a \) times \( b \),’ and means the total number of objects in \( a \) groups if there are \( b \) objects in each group.” Students will apply this concept to integers. For example, students understand \( 3 \times 5 \) as 3 groups of 5 or \( 5 + 5 + 5 \) or 15. With the same logic students move to finding \( 3 \times (-5) \). Here they should reason: “this mean 3 groups of \(-5\) or \((-5) + (-5) + (-5)\) or \(-15\).” Students will model these types of products on the real line. Next they move to products like: \((-3) \times 5\). There are two ways a student may attack this using rules of arithmetic: one way is to recognize that \((-3) \times 5\) is the same as \(5 \times (-3)\) (e.g. the commutative property) and then apply the logic above: \(-3 + (-3) + (-3) + (-3) or -15\). The other is to rely on their understanding of integers from 6th grade. There they developed the idea of \(-3\) by recognizing that it is simply the “opposite” of 3. Thus, \((-3) \times 5\) is the same as “the opposite of 3 times 5” or \((-3) \times 5\) or \((-3 \times 5)\) or \((-15)\) or \(-15\) (here they are applying the associative property). Students then find products such as \((-3) \times (-5)\). Using the logic they developed with the previous example, student should reason: \((-3) \times (-5)\) can be thought of as “the opposite of 3 times \(-5\)” or \(-(-3) \times (-5)\) or \(-(3 \times (-5))\) or \(-(-15)\) or 15. This will all be modeled on the real line. Before students move to division, they will formalize that a product involving an even number of negatives is positive while a product involving an odd number of negatives is negative (assuming none of the factors is 0). There is a more thorough discussion of these ideas in the mathematical foundation.

Students begin the transition to division of integers by reviewing the relationship between multiplication and division:

\[
(3)(5) = 15, \text{ so } \frac{15}{5} = 3 \text{ and } \frac{15}{3} = 5
\]

The mathematical foundation describes this relationship as follows, “If \( a \) and \( b \) are any integer, where \( b \neq 0 \) then \( a \div b \) is the unique (one and only one) integer (or rational number) \( c \), such that \( a = bc \).” Since division and multiplication are inverse operations, it comes as no surprise that the rules for dividing integers are the same for multiplication.

Concepts and Skills to be Mastered (from standards)

By the end of this section, students should be able to:
1. Use a model to multiply integers
2. Explain why the product of a positive and negative integer is negative or the product of a negative and negative integer is positive.
3. Use rules for multiplying and dividing integers accurately.
4. Add, subtract, multiply and divide integers fluently.
5. Solve contextual problems involving integers.
2.2 Anchor Problem

In groups of 2-3 answer the following questions. Use words and pictures to provide evidence for your answer.

1. Miguel has $500 in the bank. Each week for 12 weeks he puts $50 into his account. How much money will he have at the end of 12 weeks?

2. Rick borrowed $7 from his brother every week for 5 weeks. What is Rick’s financial situation with his brother at the end of the 5 weeks?

3. Lana wants to take a picture of her school. She stands on the sidewalk in front of her school, but she is too close to the school for her camera to capture the entire school in the frame. She takes 10 steps backwards. If each step is about 1.5 feet in length, where is she relative to where she started?

$$1.5 + 1.5 + 1.5 + 1.5 + 1.5 + 1.5 + 1.5 + 1.5$$

4. Lisa owes her mom $78. Lisa’s mom removed 4 debts of $8 each when Lisa did some work for her at her office. What is Lisa’s financial situation with her mom now?
2.2a Class Activity: Multiply Integers Using a Number Line

Review:
In elementary school you modeled multiplication in several ways: arrays, skip counting, number lines, blocks, etc. You learned:

<table>
<thead>
<tr>
<th>First factor tells you:</th>
<th>Second factor tells you:</th>
<th>Product describes:</th>
</tr>
</thead>
<tbody>
<tr>
<td>How many groups</td>
<td>How many units are in each group</td>
<td>The total with which you end</td>
</tr>
</tbody>
</table>

For example, you learned that $3 \times 5$ means three groups of 5 units in each group. The “product” is the total number of object. Three representations for $3 \times 5$ are:
In this section we will apply this understanding to multiplication of integers.

1. Show how you might use a model to do the following:

a. \[3 \times (-5)\]

b. \[(-3) \times 5\]

c. \[(-3) \times (-5)\]

\[(-3)(-5) = -(3)(-5).\] Recall that \(-3\) is the “opposite of 3.” Thus we want the opposite of 3 groups of \((-5)\).

Number line model with property: 5 \times (-3) by the commutative property is -15.

3 groups of -5 is -15. Now apply “the opposite.” The result is 15.

See number line model below.

2. How are integers (positive and negative numbers) related to the models for multiplication?
Write the meaning of each multiplication problem in terms of a number line model and then do the multiplication on the number line provided.

3. \(2 \times 3\)

Means: Two groups of three.

4. \(2 \times (-3)\)

Means: Two groups of negative three.

5. \((-2) \times 3\)

Means: The opposite of two groups of three.

6. \((-2) \times (-3)\)

Means: The opposite of two groups of negative three. \((-2) \times (-3) = -(2 \times (-3))\).
Model each multiplication problem using a number line. Write the product in the space provided.

7. \(6 \times (-3) = -18\)

8. \(6 \times 3 = 18\)

9. \(-6 \times (-3) = 18\)

\[-(6 \times (-3)) = -(18) = 18\]

10. \(-6 \times 3 = -18\)

\[-(6 \times 3) = -(18) = -18\]

11. \(2 \times (-5) = -10\)

12. \(-5 \times 2 = -10\)

\[-(5 \times 2) = -(10) = -10\]
13. \(-4 \times (-3) = 12\)

14. \(-4 \times 3 = -12\)

15. \(-6 \times (3) = -18\)

16. \(5 \times (-4) = -20\)

17. \(0 \times (-4) = 0\)
2.2a Homework: Multiply Integers

Write the meaning of each multiplication problem using a number line model. Then model the problem on the number line provided. Record the product. Look back at 2.2a Classroom Activity for assistance.

1. \(3 \times 4 = 12\)

Means: Three groups of 4.

Model:

2. \(3 \times (-6) = \)

Means:

Model:

3. \(-2 \times 6 = -12\)

Means: The opposite of two groups of 6.

Model:

4. \(-5 \times (-3) = 15\)

Means: The opposite of five groups of negative 3.

Model:

5. \(-7 \times (-2) = \)

Means:

Model:
6. \(-3 \times 4 = \)

Means:

Model:

7. \(-1 \times (-1) = 1\)

Means: The opposite of one group of negative 1.

Model:

8. \(-5 \times 0 = \)

Means:

Model:
Spiral Review

1. Daniel left a $9 tip for the waiter at a restaurant. If the tip was 15% of the bill, how much was the bill? Solve with or without a model.

   $\text{ $60}$

2. What is the greatest common factor of 65 and 39?
   
   13

3. In Mr. Garcia’s 7th Grade Math class, of the students brought a pencil to class. If 6 people did not have pencils, how many students are in Mr. Garcia’s class?

   30

4. Order the numbers from least to greatest. 10/8, 4/3, 1.4, 1.08

   1.08, $\frac{10}{8}$, $\frac{4}{3}$, 1.4

5. Express each fraction as a percent.
   
   a. $\frac{3}{20} = 15\%$  
   b. $\frac{7}{25} = 28\%$

Recall for “a” we can multiply by $\frac{5}{5}$ and “b” by $\frac{4}{4}$ to get a denominator of 100.
2.2b Class Activity: Rules and Structure for Multiplying Integers

1. Complete the multiplication chart below. Be very careful and pay attention to signs.

2. Describe two patterns that you notice in the chart.  
   Answers will vary.

3. Create a color code for positive and negative numbers (for example, you could choose yellow for positive and red for negative.) Shade the chart according to your color code.

<table>
<thead>

4. What do you notice? Do you think this pattern is a rule?  
   A positive multiplied by a positive is a positive. The product of a positive and a negative is negative. The product of two negatives is positive.

©2014 University of Utah Middle School Math Project in partnership with the Utah State Office of Education. Licensed under Creative Commons, cc-by.
Review concept:
In 6th grade, you learned that opposite signs on a number indicate locations on opposite sides of 0 on the number line. For example, \(-3\) is three units from 0, but on the opposite side of 0 than 3.

5. Use that logic to answer the following questions:

   a. What is the opposite of \(-1\)? \(1\)
   
   b. Why is \(1(-1) = (-1)(1) = -1\) a true statement? Look back at #7 from 2.2a. You can change the order of multiplication. Students might also note that 1 times anything gives you back the “anything.”
   
   c. What is the opposite of the opposite of \(-1\)? \(-1\)
   
   d. Why is \((-1)(-1) = 1\) a true statement? \(-1\) is the opposite of 1; \((-1)(-1)\) means “the opposite of the product of 1 and \(-1\). 1 multiplied by \(-1\) is \(-1\), thus \((-1)(-1)\) is \(-(-1)\) e.g. the opposite of \(-1\) or 1.

6. Use your experiences above to generalize some rules for multiplication with integers:

   a. A positive times a positive is a positive.
   
   b. A positive times a negative is a negative.
   
   c. A negative times a positive is a negative.
   
   d. A negative times a negative is a positive.

7. In groups, find each product. Be able to justify your answers for a – o.

8.

<table>
<thead>
<tr>
<th>A</th>
<th>B</th>
<th>C</th>
</tr>
</thead>
<tbody>
<tr>
<td>a.</td>
<td>2 \times 8</td>
<td>16</td>
</tr>
<tr>
<td>b.</td>
<td>5 \times (-9)</td>
<td>-</td>
</tr>
<tr>
<td>c.</td>
<td>-7 \times 7</td>
<td>-49</td>
</tr>
<tr>
<td>d.</td>
<td>-5(-3)</td>
<td></td>
</tr>
<tr>
<td>e.</td>
<td>-5(3)</td>
<td>15</td>
</tr>
<tr>
<td>f.</td>
<td>11 \times 7</td>
<td></td>
</tr>
<tr>
<td>g.</td>
<td>(4)(-3)</td>
<td>-12</td>
</tr>
<tr>
<td>h.</td>
<td>(9)(-4)</td>
<td></td>
</tr>
<tr>
<td>i.</td>
<td>(-6)(-4)</td>
<td>24</td>
</tr>
</tbody>
</table>
8. In k – o you multiplied more than two factors together. Can you extend the rules you developed in #6 for this type of situation? If you have an even number of negatives, your product will be positive, assuming no factor of 0. If there are an odd number of negatives, the products will be negative. Again assuming no 0 factors. Note: Students should have learned that 0 is even in early elementary. For students who struggle with this idea, you might point out numbers that end in 0 (10, 20, 30...) are all divisible by 2.

29. Look at the following expressions. What is the operation for each? Explain how you identified the operation and then simplify each.

Student explanations may vary.
Find each product.

1. \(-2(3) \quad -6\) 
2. \(-4(-7)\) 
3. \(8(-4) \quad -32\) 
4. \(9(7)\) 
5. \(-3(7) \quad -21\) 
6. \(-12(-3)\) 
7. \(15(-3) \quad -45\) 
8. \(15(4)\) 
9. \(-1 \times 4 \quad -4\) 
10. \(15(-8)\) 
11. \(-4 \times 13 \quad -52\) 
12. \(-13(-3)\) 
13. \(-24 \times 3 \quad -72\) 
14. \(14(-12)\) 
15. \(3(-8)(-4) \quad 96\) 
16. \(-2 \times 5 \times 10\) 
17. \(-1 \times -3 \times -6\) 
18. \(-8 \times 7 \times -3 \quad 168\)

Write a multiplication problem for each situation. Write the answer in a complete sentence.

19. Karla borrowed \$5 each from 4 different friends. How much money does Karla owe her friends altogether?

Problem: \(4 \times (-5)\) 
Answer: Karla owes \$20 to her friends.

20. The temperature increased 2º per hour for six hours. How many degrees did the temperature raise after six hours?

Problem: 
Answer:

21. Jim was deep sea diving last week. He descends 3 feet every minute. How many feet will he descend in 10 minutes?

Problem: 
Answer:
Spiral Review

1. Express each percent as a fraction in simplest form.

\[
35\% = \frac{35}{100} = \frac{7}{20} \quad 22\% = \frac{22}{100} = \frac{11}{50}
\]

2. Solve the following expression by modeling with tiles, chips, or a number line.

\[
-6 + (-3) = -9
\]

3. A snowboard at a local shop normally costs $400. Over Labor Day weekend, the snowboard is on sale for 60% off. What is the sale price of the snowboard?

\[
(1 - 0.6) \times $400 = $160.
\]

4. Place each of the following integers on the number line below. Label each point:

   A = 4  B = -4  C = -15  D = 7  E = 18  F = -19

5. \(8 - (-11) = 19\)
Review: Operations with models. Draw models to find the answer to each problem.

</tbody>
</table>

Make use of structure: How could you use related multiplication problems to find each quotient? Explain and then state the quotient.

9. $12 \div (-3)$
   $-3 \times ____ = 12; \quad -4$

10. $-8 \div (-2)$
    $-2 \times ____ = -8; \quad 4$

11. $40 \div (-10)$
    $-10 \times ____ = 40; \quad -4$

12. $-96 \div (-12)$
    $-12 \times ____ = -96; \quad 8$

13. What are the rules for dividing integers?
    The rules for dividing integers are the same as multiplying integers.
2.2c Homework: Rules and Structure for Division of Integers/Application

Find each quotient.

1. $12 \div (-4) = -3$
2. $-36 \div (-6) = 6$
3. $21 \div 3 = 7$
4. $-45 \div 9 = -5$
5. $4 \div (-1) = -4$
6. $-52 \div (-4) = 13$
7. $72 \div (-3) = -24$
8. $39 \div (-13) = -3$
9. $-28 \div (-4) = 7$
10. $-63 \div 9 = -7$
11. $-36 \div (-3) = 12$
12. $60 \div (-15) = -4$
13. $90 \div (-5) = -18$
14. $160 \div 20 = 8$

Write a division expression for each situation. Answer the question in a complete sentence.

15. Keith borrowed a total of $30 by borrowing the same amount of money from 5 different friends. How much money does Keith owe each friend?

Expression: $-30 \div 5$
Answer: Keith owes each friend $6.00.

16. The temperature fell 12º over 4 hours. What was the average change in temperature per hour?

Expression: 
Answer:

17. Max lost 24 pounds in 8 weeks on his new weight-loss plan. What was his average change in weight per week?

Expression: 
Answer:

18. Siegfried borrowed $4 a day until he had borrowed a total of $88. For how many days did he borrow money?

Expression: $-88 \div -4$ or $88 \div 4$
Answer: Siegfried borrowed money for 22 days.
**Spiral Review**

1. Juan’s football team gains 3 yards on one play. On the next play, the quarterback is sacked for a loss of 10 yards. What was the overall change in their position for the two plays? \(-7\)

2. Lisa owes her mom $78. Lisa made four payments of $8 to her mom. How much does Lisa now owe her mother? 
\(-78 + 4(8) = -46\) so Lisa owes her mom $46.

3. Write \(\frac{26}{4}\) as a mixed number. Model to solidify understanding. 
\(6\frac{2}{4}\) or \(6\frac{1}{2}\)

4. What is the greatest common factor of 24 and 56? \(8\)

5. \(5 \times (-9)\) \(-45\)
2.2c Extra Integer Multiplication and Division Practice

Solve.

1. \(3 \times 5 = 15\) 

11. \(-24 \div 12 = -2\)

2. \(96 \div (-12) =\)

12. \(33 \div (-3) =\)

3. \(-40 \div (-10) =\)

13. \(8 \times (-2) =\)

4. \(-6 \times 0 =\)

14. \(-21 \div (-3) =\)

5. \(6 \times (-10) =\)

15. \(9 \times (-4) = -36\)

6. \(-55 \div 5 =\)

16. \(20 \times 4 =\)

7. \(63 \div 9 =\)

17. \(10 \times (-4) = -40\)

8. \(-6 \div (-1) = 6\)

18. \(-5 \times (-9) =\)

9. \(-4 \times (-10) = 40\)

19. \(-40 \div (-5) = 8\)

10. \(10 \times (-3) =\)

20. \(1 \div (-1) =\)

Write an equation and then solve. Write a sentence representing your answer.

11. Alicia owes $6 to each of 4 friends. How much money does she owe?

12. A video game player receives $50 for every correct answer and pays $45 every time he gets a question incorrect. After a new game of 30 questions, he misses 16. How much money did he end up with?

\[(14 \times 50) + (16 \times (-45)) = 700 + (-720) = -20;\]

Overall he lost $20.

13. An oven temperature dropped 135° in 15 minutes. If the temperature dropped at a constant rate, how many degrees per minute did the temperature drop?
2.2d Extra Practice: Multiple Operations Review

1. The coldest place in Utah is Middlesink, near Logan. One day the temperature there was \(-17\) degrees. You drive from Middlesink to Salt Lake where the temperature is 30 degrees. What is the change in temperature? Explain.

\[30 - (-17) = 47;\] You experience a temperature change of 47 degrees.

Student explanations will vary.

2. You are playing a board game and you have to pay $50. Then you win $200. After that, you have to pay $800.

a. Write the expression that represents this situation.

b. What integer represents the amount of money you end up with?

3. You go into a business partnership with three other friends. Your business loses $65,000. You agree to share the loss equally. How much money has each of the four people lost?

\[-65,000 \div 4 = -16,250\] Each person loses $16,250.

Integers Review: Perform the indicated operation.

4. \(5 + (-3)\) 2

9. \(-5(3)\) –

14. \(15 \div (-3)\) –5

5. \(3 - 5\)

10. \(13 - (-5)\) 18

15. \(-4 + 12\)

6. \(-15 \times 2\) –30

11. \(-2(-3)\)

16. \((-5) + (-4)\) –9

7. \(-6 \div (-2)\)

12. \(12 \div 12\)

17. \(-9(2)\)

8. \(-14 - (-6)\) –8

13. \((-6) - (-10)\)

18. \(-\frac{20}{4}\) –5
Consider the following skills/concepts. Rate your comfort level with each skill/concept by checking the box that best describes your progress in mastering each skill/concept. Corresponding sample problems, referenced in brackets, can be found on the following page.

Sample Problems for Section 2.2

1. Draw a model (chips, array or number line) to solve each of the following multiplication problems.
   a. \(-1(7)\)  
   b. \(-3(-6)\)  
   c. \(8(-8)\)  
   d. \(-2\cdot7\)

2. Explain why the product of a positive and negative integer is negative or the product of a negative and negative integer is positive, using pictures, models, and words for your explanation.

3. Find each product or quotient.
   a. \(9 \cdot 4\)  
   b. \(-\frac{14}{-7}\)  
   c. \(5(-2)\)  
   d. \(-\frac{80}{8}\)  
   e. \(-9 \cdot -2\)  
   f. \(-\frac{48}{2}\)

4. Simplify each.
   a. \(-6(-5)\)  
   b. \(-16(-3)\)  
   c. \(-\frac{81}{-9}\)  
   d. \(-4 + 21\)  
   e. \(-10 \cdot 31\)  
   f. \(-89 + (-6)\)  
   g. \(6 - 9\)  
   h. \(-\frac{40}{8}\)

5. Solve each of the following contextual problems involving integers.
   a. David is in a submarine at 200 feet below sea level. Casey is above him in a helicopter at 5,900 feet altitude. How far apart are David and Casey?
   b. Scuba diving, Elisa descends at a rate of 30 feet per minute. How long will it take her to reach a depth of 90 feet?
   c. Rome was founded in 753 BCE. Rome fell in 476 ACE. How many years passed between Rome’s founding and fall?
Section 2.3: Add, Subtract, Multiply, Divide Positive and Negative Rational Numbers (all forms)

Section Overview:
In this section students extend their understanding of operating with integers to operating with all rational numbers. Students start with an activity to help them think about: 1) a line as a way to represent numbers, 2) rational numbers as numbers that can be written in the form \(\frac{a}{b}\), where \(b \neq 0\), and 3) locating any number that can be written as \(\frac{a}{b}\) (any rational number) on the number line. Students then move to operating with rational numbers in all forms by applying the rules of arithmetic that they should have solidified in the previous two sections.

A central idea throughout this section is the importance of estimating quantities before one computes. This is not only an important life skill; it’s also an important skill in making sense of answers and working with technology. Students should get in the habit of estimating answers before they compute them so that they can check the reasonableness of their results.

Concepts and Skills to be Mastered (from standards)

By the end of this section, students should be able to:

1. Estimate the sum, difference, product or quotient of positive and negative rational numbers.
2. Find the sum or difference of rational numbers fluently.
3. Find the product or quotient of rational numbers fluently.
4. Solve contextual problems involving positive and negative rational numbers.
5. Explain why division by 0 is undefined.
2.3a Class Activity: Rational Numbers/Number Line City—Add, Subtract Rational Numbers

Activity: Create your own number line with the length of string your teacher gave you. Pick a spot in the middle of your line for “0”. Your “units” will be the length of your string. You will also find other points on your line. The mathematical ideas on which this activity is based can be found in the mathematical foundation page.
In Number Line School, there is one straight hallway. The numbers on the classrooms indicate the distance from the main office, which is at zero. Mark the location of the following classrooms on the map of Number Line School below. Students may benefit if you ask them to write an expression to find the difference on some/all of these problems. You may decide to assign this activity as homework if the above activity took too much class time.

Mr. Bowen: $-3\frac{1}{4}$  
Ms. England: $-6\frac{1}{4}$  
Mr. Francks: $-8\frac{1}{3}$  
Ms. Abe: 3.5  
Mrs. Chidester: 5.25  
Mr. David: $-5.2$

![Number Line School diagram]

Work with your group to answer the following questions. Be sure to explain your reasoning! Students' explanations may vary.

1. Whose classroom is further from the Main Office, Ms. Abe, or Mrs. Chidester?
   - Mrs. Chidester because she is more than five units away while Ms. Abe is less than four units away.

2. a. **Approximately** how far apart are Ms. Abe and Mrs. Chidester? **Approximately 2 units**
   
   b. **Exactly** how far apart are Ms. Abe and Mrs. Chidester? **1.75 units**

3. Joe has Mr. Bowen’s class first hour and Ms. England’s class second hour. How far must he walk to get from Mr. Bowen’s class to Ms. England’s class? Estimate your answer before you compute it.
   - He must walk 3 units.

4. What is the distance between Mrs. Chidester’s class and Mr. David’s class? Estimate your answer before you compute it.
   - Approximately 10 units
   - The distance between their classes is 10.45 units.

5. What is the distance between Mr. Franck’s class and Ms. England’s class? Estimate your answer before you compute it.
   - Approximately 2 units
   - The distance between their classes is $\frac{21}{12}$ units.
2.3a Homework: Rational Numbers/Number Line City

In Number Line City, there is one straight road. All the residents of number line city live either East (+) or West (−) of the Origin (0). All addresses are given as positive or negative rational numbers. Label the location of the following addresses on the map of Number Line City below with a point and the first letter of the resident (for example put a “B” above the point for Betsy.):

- **Betsy**: −1\(\frac{3}{4}\)
- **Allyson**: −2.5
- **Chris**: 5\(\frac{1}{2}\)
- **David**: 6.0
- **Frank**: \(\frac{10}{4}\)
- **Emily**: 7.25
- **Hannah**: 6\(\frac{1}{5}\)
- **Jamee**: −6.2
- **Number Line School**: 1\(\frac{1}{2}\)
- **Town Hall**: 0
- **Grocery Store**: −4.8
- **Post Office**: −10

Now answer the following questions. Estimate your answer first, then compute it.

1. **How far is it from Allyson’s house to Betsy’s house?**

2. **How far is it from Chris’ house to Betsy’s house?**
   - It is West 7.25 units from Chris’ house to Betsy’s house.

3. **How far is it from David’s house to Chris’ house?**

4. **How far is it from Emily’s house to Jamee’s house?**
   - It is West 13.45 units to Jamee’s house.

5. **Who lives closer to the Grocery Store, Allyson or Jamee?** Explain.

6. **Who lives closer to Town Hall, Jamee or Hannah?** Explain.
   - Jamee and Hannah live the same distance from Town Hall.
7. The mailman leaves the post office and makes a delivery to Hannah, picks up a package from Jamee, and then delivers the package to Frank before returning to the post office. How far did the mailman travel?

8. Every morning, Betsy walks to Allyson’s house and they walk together to school. How far does Betsy walk each morning?
   Betsy walks 4.75 units each morning.

9. Iris moves into Number Line City. She finds out that she lives exactly 3.45 units from Emily. Where does Iris live?

10. Logan moves into Number Line City. He moves into a home 2¼ units from Chris’ home. Where could Logan live? Where do you suggest he live and why?
    Logan would live at 7.75 or 3.25.
    Students’ suggestions of where he lives will vary.

**Spiral Review**

1. Solve
   a. $16 - 25 = $ 
   b. $-2 - (-8) = $ 
   c. $5 + -11 = $ 
   d. $-81 - 19 = $ 

2. Model $\frac{4}{5} - \frac{2}{3} = $ 
   \[\frac{2}{15}\]  

3. Jack and Jill went on their first date to Chili’s. Their food bill totaled $32.00 plus the 15% tip they need to pay the waitress.
   a. How much will their 15% tip be? $4.80 
   b. How much will Jack pay in all? $36.80
2.3b More Operations with Rational Numbers

Review: Addition/Subtraction

In elementary school, you learned the following:

Example 1: Adding is a way to simplify or collect together things that are the same units.

3 apples + 4 apples = 7 apples

3 apples + 4 bananas = 3 apples + 4 bananas

Example 2: Place value matters when you add whole numbers because you want to add units that are the same.

24 + 7 ≠ 94 (you can’t add the 2 to the 7 because the “2” represents the number of tens and the “7” represents the number of ones—they are not the same kinds of units.) 24 + 7 = 31.

Example 3: Place value matters when you add decimals, again you want to add the same kinds of units.

3.2 + 4.01 ≠ 4.3 3.2 + 4.01 = 7.21

Example 4: To add or subtract fractions you must have the same units, thus you must have a common denominator.

\[\frac{1}{2} + \frac{1}{3}\] and \[\frac{2}{6}\] are not the same units. But, \[\frac{3}{6}\] and \[\frac{2}{6}\] can be added because the units \[\frac{1}{6}\] are the same. There are a total of five one-sixth units or \[\frac{5}{6}\].
In this chapter we have learned how to add and subtract with integers first with models and then by applying rules. We will now apply these skills to all rational numbers.

1. Think back to the activity you did in 2.3a; what is a “rational number”?

Students should do the exercises below by applying the skills they learned earlier in this chapter; e.g.: \(a - b = a + (-b)\) and \(a - (-b) = a + b\)

Find the sum or difference for each.

Review: Multiplication and Division

Review the general multiplication models in 2.2a Class Activity. Remember that multiplying means you have a certain number of groups with a certain number of units per group. You do NOT need a common denominator for multiplication.

**Example 5:** Whole number by fraction or fraction by whole number

\[3 \times \frac{3}{4}\] means three groups of \(\frac{3}{4}\), so \(3 \times \frac{3}{4} = \frac{9}{4} = 2 \frac{1}{4}\)

\[\frac{2}{3} \times 6\] means two-thirds of a group of six, so \(\frac{2}{3} \times 6 = 4\)

**Example 6:** Fraction by a fraction

\[\frac{1}{2} \times \frac{1}{3}\] means “one-half groups of one-third.”

**Example 7:** Division, whole number by a fraction

Recall that division is the inverse of multiplication. In other words, you’re looking for a missing factor when you divide. 12 ÷ 3 can mean that you’re starting with 12 and you want to know how many groups of 3 units are in 12. Similarly, 4 ÷ \(\frac{2}{3}\) can mean starting with 4 and want to know how many groups of \(\frac{2}{3}\) are in 4.

12 ÷ 3 = 4 because there are four groups of 3 units in 12.

Similarly, 4 ÷ \(\frac{2}{3}\) = 6 because there are 6 groups of \(\frac{2}{3}\) in 4.
The other way to think about $12 \div 3$ is, you’re starting with 12 and you want to know how many units are in each \textit{whole} group if you have 3 groups. Similarly, $4 \div \frac{2}{3}$ can be thought of as starting with 4 and you want to know how many are in a \textit{whole} group if you have $\frac{2}{3}$ of a group:

![Diagram illustrating division concepts](image_url)

</table>
2.3c Class Activity: Multiply and Divide Rational Numbers

Work in groups to extend your understanding of multiplying and dividing rational numbers.

1. Will the product of \( \left( \frac{3}{4} \right) \left( \frac{1}{4} \right) \) be bigger or smaller than each of the factors? Explain.
   It will be smaller than \( \frac{3}{4} \) and \( \frac{1}{4} \) because we are taking part (3/4) of a group of 1/4.
   Find the product to check your explanation.
   \( \frac{3}{16} \)

2. Explain the value of the product \( \left( \frac{3}{4} \right) (2) \). Will it be bigger or smaller than each of the factors?
   It will be bigger than \( \frac{3}{4} \) and smaller than 2.
   Find the product to check your explanation.
   \( 1 \frac{1}{2} \)

3. Explain the value of the product \( \left( \frac{3}{4} \right) (0.5) \). Will it be bigger or smaller than each factor?
   It will be smaller than \( \frac{3}{4} \) and 0.5.
   Find the product to check your explanation.
   0.375

4. Will the quotient of \( \frac{3}{4} \div \frac{1}{4} \) be bigger or smaller than each term? Explain.
   It will be bigger than \( \frac{3}{4} \) and \( \frac{1}{4} \).
   Find the quotient to check your explanation.
   3

5. Explain the quotient \( \frac{3}{4} \div 2 \). Will it be bigger or smaller than each term?
   It will be smaller than \( \frac{3}{4} \) and smaller than 2.
   Find the quotient to check your explanation.
   \( \frac{3}{8} \)

6. Explain the quotient \( \frac{3}{4} \div 0.5 \). Will it be bigger or smaller than each term?
   It will be bigger than \( \frac{3}{4} \) and 0.5.
   Find the quotient to check your explanation.
   1.5
Estimate by rounding to the nearest integer. Discuss in your group if your answer is an over estimate or an under estimate of the actual value. Be able to justify your answer.

8. \[ \frac{3\frac{1}{3}}{\frac{7}{9}} \approx \ \_\_\_\_ \div \_\_\_\_ \approx \_\_\_\_ \approx 3 \div 1 \approx 3 \]

9. \[ \left( 6\frac{1}{3} \right) (2.2) \approx (\_\_\_\_)(\_\_\_\_) \approx \_\_\_\_ \]

10. \[ \frac{4\frac{1}{9}}{7.891} \approx \_\_\_\_ \div \_\_\_\_ \approx \_\_\_\_ \]

11. \[ \left( \frac{4}{5} \right) (-5.9) \left( \frac{4}{10} \right) \approx (\_\_\_\_)(\_\_\_\_)(\_\_\_\_) \approx \_\_\_\_ \]

Estimate and then confirm your estimation by finding the exact value with a calculator.

12. \[-0.875 \div \frac{2}{7} \approx \_\_\_\_\_\_ \approx -12 \approx -1/(4) \approx -4 \]

Exact value: \[ -\frac{49}{16} \]

13. \[ \left( \frac{3\frac{3}{5}}{2\frac{1}{10}} \right) \approx \_\_\_\_\_\_ \approx 7/2 \ (2) \approx 7 \]

Exact value: \[ \frac{189}{25} \]

14. \[ 0.75 \left( \frac{2}{11} \right) \left( \frac{11}{12} \right) \approx \_\_\_\_\_\_ \approx (\_\_\_\_ \div 10) \ (1) \approx 2/10 \]

Exact value: \[ \frac{1}{8} \]

15. \[ \frac{3\frac{4}{5}}{-19} \approx \_\_\_\_\_\_ \approx 4 \div -20 \approx -1/5 \]

Exact value: \[ -\frac{1}{5} \]

16. \[ (-9) \left( -8\frac{1}{4} \right) \approx \_\_\_\_\_\_ \approx (-9)(-8) \approx 72 \]

Exact value: \[ \frac{741}{4} \]

\[ 9\frac{3}{4} \div 12\frac{1}{4} \approx \_\_\_\_\_\_ \approx 9 \div 12 \approx 9/12 \text{ or } 3/4 \]

Exact value: \[ \frac{39}{49} \]
Exploration Activity:

Divide each

a. \(12 \div 12 = 1\)  
g. \(12 \div 1/2 = 24\)

b. \(12 \div 6 = 2\)  
h. \(12 \div 1/3 = 36\)

c. \(12 \div 4 = 3\)  
i. \(12 \div 1/4 = 48\)

d. \(12 \div 3 = 4\)  
j. \(12 \div 1/6 = 72\)

e. \(12 \div 2 = 6\)  
k. \(12 \div 1/12 = 144\)

f. \(12 \div 1 = 12\)

What do you notice?

Students should notice that, for a given dividend, the smaller the divisor the larger the quotient and the larger the divisor the smaller the quotient.

Divide each:

l. \(1/2 \div 12 = 1/24\)  
q. \(1/2 \div 1/2 = 1\)

m. \(1/2 \div 6 = 1/12\)  
r. \(1/2 \div 1/3 = 3/2\)

n. \(1/2 \div 4 = 1/8\)  
s. \(1/2 \div 1/4 = 2\)

o. \(1/2 \div 2 = 1/4\)  
t. \(1/2 \div 1/6 = 3\)

p. \(1/2 \div 1 = 1/2\)  
u. \(1/2 \div 1/12 = 6\)

What do you notice?

Students should notice that, for a given dividend, the smaller the divisor the larger the quotient and the larger the divisor the smaller the quotient. Ask students if the pattern would hold if you were dividing by a negative.

What is your conjecture about \(12 \div 0\) or \(1/2 \div 0\)? Justify your conjecture.

Discuss with students why these are undefined quotients. You may also want to go back to the discussion about division as the inverse of multiplication, e.g. if \(12 \div 0 = 0\), then \(0 \times 0\) would have to equal 12.

What do you think would happen if we took any (nonzero) number, \(b\), and divided by 0?
2.3c Homework: Multiply and Divide Rational Numbers

Multiplying and dividing rational numbers. For #5 - 13 estimate first, then compute.

1. Will the product of \((2)\left(\frac{1}{3}\right)\) be bigger or smaller than each of the factors? Explain
   
   It will be bigger than \(\frac{1}{3}\) and smaller than 2. As written, this means two groups of \(\frac{1}{3}\) which will be bigger than \(\frac{1}{3}\). However, using the commutative property of multiplication gives \(\frac{1}{3} \times 2\) or one third of a group of two. Therefore the product is smaller than 2.

2. Will the product of 2 and 3 be bigger or smaller than each factor? Explain.

3. Explain the quotient \(2 \div \frac{1}{3}\): will it be bigger or smaller than each term?

4. Will the quotient of \(\frac{1}{3} \div 2\) be bigger or smaller than each term?

5. \((2)\left(\frac{1}{3}\right) = \frac{2}{3}\)

6. \(5 \times \frac{1}{4} = \)

7. \(\frac{1}{2} \div 0 = \)

8. \(\frac{2}{3} \times 5 = \)

9. \((2\frac{1}{2}) (3.5) = 8.75\)

10. \(\frac{2}{7} \div -0.9 = \frac{-20}{63}\)

11. \(3 \div \frac{1}{2} = \)

12. \(\frac{5}{8} \div 3.7 = \)

13. \(\frac{1}{2} \div 4 = \)
Spiral Review

Solve the following with or without a model

1. \((-12)(-10) = 120\)

2. \(23 + (-23) = 0\) (additive inverse)

3. \(\frac{1}{6} + \frac{3}{7} = \frac{7}{42} + \frac{18}{42} = \frac{25}{42}\)

4. \(0.85 + \frac{1}{2} = 1.35\) or \(\frac{27}{20}\)

5. The temperature increased 2° per hour for six hours. How many degrees did the temperature raise after six hours? \(6 \times 2 = 12\) so 12 degrees.
Estimate each product or quotient and then compute.

Students should estimate first.

1. \(-0.5 \times \frac{1}{3} = \frac{-1}{6}\)

2. \(\frac{5}{9} \div \left( \frac{-5}{6} \right)\)

3. \(-0.375 \times \frac{2}{9} = \frac{-1}{12}\)

4. \(\left( \frac{-2}{7} \right) \times \left( \frac{-1}{3} \right) = \)

5. \(\frac{8}{9} \div 0.2 = \frac{40}{9}\)

6. \(-0.75 \times \frac{1}{3} =\)

7. \(\frac{4}{5} \times \frac{5}{8} = \frac{1}{2}\)

8. \(\frac{7}{8} \div \left( \frac{-2}{3} \right) =\)

9. \(\frac{2}{7} \div \frac{1}{7} =\)

10. \(\left( \frac{-2}{3} \right) \times -0.4 = \frac{4}{15}\)

11. \(\)

12. \(\left( \frac{-2}{3} \right) \div 0.24 = \frac{-25}{9}\)

13. \(0.25 \div \frac{1}{3} =\)

14. \(0.4 \times \left( \frac{-1}{2} \right) = \frac{-1}{5}\)

15. \(-0.75 \div \left( \frac{3}{8} \right) =\)

16. \(\frac{3}{4} \div 0.125 =\)

17. \(\left( \frac{-1}{7} \right) \div \left( \frac{-1}{5} \right) =\)

18. \((-0.2) \div \frac{3}{7} = \frac{-7}{15}\)

19. \(\frac{3}{7} \times \frac{7}{12} =\)

20. \(\left( \frac{-4}{11} \right) \div \left( \frac{-8}{11} \right) = \frac{1}{2}\)
2.3d Class Activity: Multiply and Divide continued

For questions #1 – 5, do each of the following:

a. Write an equation or draw model.
b. Estimate an answer.
c. Find the exact answer.

1. Dory can run 3.25 miles every hour. How long will it take her to run a race that is $16\frac{1}{4}$ miles long?

$16\frac{1}{4} \div 3.25 = 5$

Note: Students might “count up” to get to the solution. In other words they might think; 
$3.25 + 3.25 + 3.25...$until they get to $16.25$. That works too. Allow students to think about the problems in ways that make sense to them rather than worry about algorithmic approaches. Have students share their thinking.

It will take Dory 5 hours to run the race.

2. From 6 p.m. to 6 a.m. the temperature dropped 1.4 degrees each hour. What was the total change in temperature between 6 p.m. and 6 a.m.?

$12 \times (-1.4) = -16.8$

The temperature dropped 16.8 degrees.

3. Bridgette wants to make 14 matching hair bows for her friends. Each hair bow requires $\frac{3}{4}$ of a yard of ribbon. How many yards of ribbon will Bridgette need to make all the hair bows?

$14 \times \frac{3}{4} = 10\frac{1}{2}$

Bridgette needs $10\frac{1}{2}$ yards of ribbon.

4. There are 18 apple trees in my orchard. If I can harvest the fruit from $\frac{2}{3}$ trees each day, how many days will it take to harvest the entire orchard?

$18 \div \frac{2}{3} = 10\frac{4}{5}$

It will take $10\frac{4}{5}$ days to harvest the entire orchard.

5. I want to use a recipe for muffins that calls for 3 cups of flour and 2 eggs. If I only have 1 egg, how much flour should I use?

$\frac{1}{2} \times 3 = \frac{3}{2}$

I should use $1\frac{1}{2}$ cups of flour.
For problems # 6 – 15, first estimate, then compute.

Students’ answers may be in decimal or fraction form. Estimations may vary.

6. \((-0.5)\left(\frac{5}{3}\right)\) =

   Estimate: \(\approx (-0.5)(2) \approx -1\)
   Actual: \(-\frac{5}{6}\)

7. \((-0.75)\left(\frac{5}{7}\right)\) =

   Estimate: \(-0.5\)
   Actual: \(-\frac{15}{28}\)

8. \(-0.23 \times \left(-\frac{2}{5}\right)\) =

   Estimate: 0.1
   Actual: 0.092

9. \(\frac{1}{2}\left(-\frac{1}{3}\right)\) =

   Estimate: \(-\frac{1}{6}\)
   Actual: \(-\frac{1}{6}\)

10. \(\left(\frac{2}{3}\right)(-0.8)\) =

    Estimate: \(-0.5\)
    Actual: \(-\frac{8}{15}\)

11. \(\frac{3}{4} \div 0.25 =\)

    Estimate: 3
    Actual: 3

12. \(\frac{1}{4} \div \left(-\frac{1}{3}\right) =\)

    Estimate: \(-0.75\)
    Actual: \(-\frac{3}{4}\)

13. \(\frac{2}{5} \div (-0.86) =\)

    Estimate: 0.5
    Actual: \(\frac{20}{43}\)

14. \(-\frac{1}{5} \div \left(-\frac{2}{3}\right) =\)

    Estimate: 0.3
    Actual: \(\frac{3}{10}\)

15. Write a context (story) for the given problem:
    \(5 \times \frac{3}{4} =\)
    Answers will vary.

16. Write a context (story) for the given problem:
    \(2 \div \frac{1}{3} =\)
    Answers will vary. Bill has two pizzas. If each friend can eat 1/3 of a pizza, how many friends can Bill invite to eat pizza?
2.3d Homework: Problem Solve with Rational Numbers

Student explanations and work may vary.

<table>
<thead>
<tr>
<th>Problem</th>
<th>Estimate the quantity, show how you arrived at your estimate</th>
<th>Calculate (show your work)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. ( \frac{2}{3} - 4.8 )</td>
<td>( 2 - 5 \approx -3 )</td>
<td>( 2.3 - 4.8 = -2.46 \text{ or } -2 \frac{7}{15} )</td>
</tr>
<tr>
<td>2. ( (8.6) \left( -\frac{3}{4} \right) )</td>
<td></td>
<td></td>
</tr>
<tr>
<td>3. ( -4.7 \div \frac{1}{4} )</td>
<td>(-5 \times 4 \approx -20)</td>
<td>(-4.7 \div 0.25 = -18.8)</td>
</tr>
<tr>
<td>4. ( \frac{2}{2} + \left( -\frac{3}{4} \right) + 0.75 )</td>
<td></td>
<td></td>
</tr>
<tr>
<td>5. ( \frac{5}{8} \left( -0.125 \right) )</td>
<td></td>
<td></td>
</tr>
<tr>
<td>6. ( \frac{1}{2} \left( -\frac{3}{7} \right) \left( 1.75 \right) )</td>
<td>( \frac{1}{2} \times \frac{1}{2} \times 2 \times \frac{1}{2} )</td>
<td>( \frac{1}{2} \left( -\frac{3}{7} \right) \left( \frac{7}{4} \right) = -\frac{3}{8} )</td>
</tr>
<tr>
<td>7. ( \frac{1}{6} + \frac{1}{12} + \left( -0.25 \right) + 1.5 )</td>
<td>( 0.2 + 0 + (-0.25) + 1.5 \approx 1.45 )</td>
<td>( \frac{2}{12} + \frac{1}{12} + \left( -\frac{3}{12} \right) + \frac{18}{12} = \frac{18}{12} = 1 \frac{1}{2} )</td>
</tr>
<tr>
<td>8. (-7 \frac{1}{2} \div -2.5 )</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Estimate first, then calculate. Finally, evaluate whether your answers are reasonable by comparing the estimate with the calculated answer. Correct your answers when appropriate.

9. Janice is ordering a new pair of eyeglasses. The frames she wants cost $98.90. High index lenses cost $76.00. Her insurance says that they will pay $100 of the cost, and 20% of the remaining amount. How much will Janice have to pay?

**Estimate:** Cost \( \approx $100 + $80 \). Insurance pays $100 plus 20% off of $80 remaining which is $16. Janice pays $64. Total: $98.90 + $76 = $174.90.

Insurance pays: \( 100 + 0.2 \times (74.90) = $114.98 \). So Janice pays: \( 174.90 - 114.98 = $59.92 \)
10. Fernando entered a weight-loss contest. The first week he lost $\frac{5}{4}$ pounds, the next week he lost 4.59 pounds and the last week he lost 2.31 pounds. What was his total change in weight? 

11. A marathon is 26.2 miles. June wants to run the distance of a marathon in a month, but she thinks that she can only run $\frac{3}{4}$ of a mile each day. How many days will she need to run? Will she be able to finish in a month? 

**Estimate:** $26 \div 1 = 26$

$26.2 \div 0.75 = 34.933$

June will need about 35 days. She will not be able to finish at that rate.

12. Reynold just got hired to paint fences this summer. He gets paid $0.60 for every foot of fencing that he paints. If Reynold paints an average of 45 yards of fencing a week, how much can he earn in $8 \frac{2}{5}$ weeks?

13. A super freezer can change the internal temperature of a 10 pound turkey by $-2.4^\circ F$ every 10 minutes. How much can the freezer change the temperature of the turkey in $3 \frac{3}{4}$ hours?

14. Dylan is ordering 5 dozen donuts for his grandmother’s birthday party. He wants $\frac{1}{4}$ of the donuts to be chocolate frosting with chocolate sprinkles, and $\frac{1}{3}$ of the donuts to have caramel frosting with nuts. The rest of the donuts will just have a sugar glaze. The donuts with the sugar glaze cost $0.12 each, and the other donuts cost $0.18 each. How much will Dylan have to pay for all the donuts?

**Estimate:** $0.15 \times 60 = $9.00

$0.18 \times \frac{1}{4} \times 60 + 0.18 \times \frac{1}{3} \times 60 + 0.12 \times 25 = 9.30$

Dylan will have to pay $9.30

15. Penny and Ben want to buy new carpet for their living room. They measured the dimensions of the living room and found that it was $12 \frac{1}{4}$ feet by $8 \frac{5}{8}$ feet. They know that installation will cost $37.50. If Penny and Ben want to spend no more than $500 on carpet, how much can they afford to pay for each square foot?
1. Use the chip model to solve $-14 + 5$.

$-9$

2. What percent of 80 is 60? $75\%$

3. Parker earned $450 over the summer. If he put 70% of his earnings into his savings, how much money did he have left over?

$450(1 - 0.70) = $135$

4. Order the numbers from least to greatest.

$-2.15, -2.105, \frac{17}{7}, 2.7$

5. Max has $150. He spends $2/3$ of his money on groceries. How much money did he have left over?

$50$
### 2.3e Self-Assessment: Section 2.3

Consider the following skills/concepts. Rate your comfort level with each skill/concept by checking the box that best describes your progress in mastering each skill/concept. Corresponding sample problems, referenced in brackets, can be found on the following page.

</tr>
</tbody>
</table>
Sample Problems for Section 2.3

1. Estimate sum or difference then find the actual value.
   a. \(-0.9 - \frac{4}{9}\)  
   e. \(-\frac{5}{8} - \frac{5}{6}\)
   b. \(-0.2 + \left(-\frac{2}{5}\right)\)  
   f. \(-0.9 - \frac{4}{9}\)
   c. \(8 - (-0.8)\)  
   g. \(-\frac{1}{2} + 4\)
   d. \(-2.5 - \frac{3}{4}\)

2. Estimate each product or quotient. Then find the actual product or quotient.
   a. \(-6 \left(\frac{1}{6}\right)\)  
   e. \(-10 \div \frac{1}{2}\)
   b. \(-1.6(-0.4)\)  
   f. \(-\frac{8}{9} \div \left(-\frac{3}{4}\right)\)
   c. \(-\frac{8}{9} (0.5)\)  
   g. \(\frac{6.3}{-0.7}\)
   d. \(-4(-0.2)\)  
   h. \(-\frac{3}{8} \div -0.9\)

3. Solve each of the following contextual problems involving rational numbers. Express answers as fractions or decimals when appropriate.
   a. Viviana buys a 500 mL bottle of water. She knows that she usually drinks 80 mL each hour. How many hours will it take her to finish her bottle of water?
   
   b. The temperature at midnight was \(-2^\circ\) C. By 8 am, it had risen 1.5\(^\circ\). By noon, it had risen another 2.7\(^\circ\). Then a storm blew in, causing it to drop 4.7\(^\circ\) by 6 pm. What was the temperature at 6 pm?
   
   c. Xochitl has saved $201.60. Yamka has saved \(\frac{2}{3}\) the amount Xochitl saved. Zack has saved 1.5 times the amount Yamka saved. How much have they save all together?

CHAPTER 3: Expressions and Equations Part 1
(4-5 weeks)

UTAH CORE Standard(s): Expressions and Equations
1. Apply properties of operations as strategies to add, subtract, factor, and expand linear expressions with rational coefficients. 7.EE.1

2. Understand that rewriting an expression in different forms in a problem context can shed light on the problem and how the quantities in it are related. 7.EE.2

3. Solve multi-step real-life and mathematical problems posed with positive and negative rational numbers in any form (whole numbers, fractions, and decimals), using tools strategically. Apply properties of operations to calculate with numbers in any form; convert between forms as appropriate; and assess the reasonableness of answers using mental computation and estimation strategies. 7.EE.3

4. Use variables to represent quantities in a real-world or mathematical problem, and construct simple equations to solve problems by reasoning about the quantities. 7.EE.4
   a. Solve word problems leading to equations of the form px + q = r and p(x + q) = r, where p, q, and r are specific rational numbers. Solve equations of these forms fluently. Compare an algebraic solution to an arithmetic solution, identifying the sequence of the operations used in each approach. 7.EE.4a

CHAPTER OVERVIEW:
The goal of chapter 3 is to facilitate students’ transition from concrete representations and manipulations of arithmetic and algebraic thinking to abstract representations. Each section supports this transition by asking students to model problem situations, construct arguments, look for and make sense of structure, and reason abstractly as they explore various representations of situations. Throughout this chapter students work with fairly simple expressions and equations to build a strong intuitive understanding of structure (for example, students should understand the difference between 2x and x^2 or why 3(2x – 1) is equivalent to 6x – 3 and 6x + –3). Students will continue to practice skills manipulating algebraic expressions and equations throughout Chapters 4 and 5. In Chapter 6, students will revisit ideas in this chapter to extend to more complicated contexts and manipulate with less reliance on concrete models. Another major theme throughout this chapter is the identification and use in argument of the arithmetic properties. The goal is for students to understand that they have used the commutative, associative, additive and multiplicative inverse, and distributive properties informally throughout their education. They are merely naming and more formally defining them now for use in justification of mathematical (quantitative) arguments. See the Mathematical Foundation for more information.

Section 3.1 reviews and builds on students’ skills with arithmetic from previous courses to write basic numerical and algebraic expressions in various ways. In this section students should understand the difference between an expression and an equation. Further, they should understand how to represent an unknown in either an expression or equation. Students will connect manipulations with numeric expressions to manipulations with algebraic expressions. In connecting the way arithmetic works with integers to working with algebraic expressions, students name and formalize the properties of arithmetic. By the end of this section students should be proficient at simplifying expressions and justifying their work with properties of arithmetic.

Section 3.2 uses the skills developed in the previous section to solve equations. Students will need to distribute and combine like terms to solve equation. In 7th grade, Students only solve linear equations in the form of
ax + b = c or \( a(x + b) = c \), where \( a \), \( b \), and \( c \) are rational numbers. This section will rely heavily on the use of models to solve equations, but students are encouraged to move to abstract representation when they are ready and fluent with the concrete models.

Section 3.3 ends the chapter with application contexts. Contexts involve simple equations with rational numbers. Percent increase and decrease is revisited here. Time should be spent understanding the meaning of each part of equations and how the equation is related to the problem context. Note that the use of models is to develop an intuitive understanding and to transition students to abstract representations of thinking.

**VOCABULARY:** coefficient, constant, expression, equation, factor, integer, like terms, product, rational number, simplify, term, unknown, variable.

**CONNECTIONS TO CONTENT:**

**Prior Knowledge:**
Students extend the skills they learned for operations with whole numbers, integers and rational numbers to algebraic expressions in a variety of ways. For example, in elementary school students modeled \( 4 \times 5 \) as four “jumps” of five on a number line. They should connect this thinking to the meaning of “\( 4x \)” or “\( 4(x + 1) \).” Students also modeled multiplication of whole numbers using arrays in earlier grades. In this chapter they will use that logic to multiply using unknowns. Additionally, in previous grades, students explored and solidified the idea that when adding/subtracting one must have “like units.” Thus, when adding \( 123 + 14 \), we add the “ones” with the “ones,” the “tens” with the “tens” and the “hundreds” with the “hundreds”. Similarly, we cannot add \( \frac{1}{2} \) and \( \frac{1}{3} \) without a common denominator because the unit of \( \frac{1}{2} \) is not the same as a unit of \( \frac{1}{3} \). Students should extend this idea to adding variables. In other words, \( 2x + 3x \) is \( 5x \) because the unit is \( x \), but \( 3x + 2y \) cannot be simplified further because the units are not the same (three units of \( x \) and two units of \( y \)).

In 6th grade, students solved one-step equations. Students will use those skills to solve equations with more than one-step in this chapter. Earlier in this course, students developed skills with rational number operations. In this chapter, students will be using those skills to solve equations that include rational numbers.

**Future Knowledge:**
As students move on in this course, they will continue to use their skills in working with expressions and equations in more complicated situations. The idea of inverse operations will be extended in later grades to inverse functions of various types. Additionally, students in later grades will return to the idea of field axioms.

A strong foundation in simplifying expressions and solving equations is fundamental to later grades. Students will also need to be proficient at translating contexts to algebraic expressions and equations AND at looking at expressions and equations and making sense of them relative to contexts.
### MATHEMATICAL PRACTICE STANDARDS (emphasized):

| Make sense of problems and persevere in solving them | Students will make sense of expressions and equations by creating models and connecting intuitive ideas to properties of arithmetic. Properties of arithmetic should be understood beyond memorization of rules. |
| Reason abstractly and quantitatively | Students will, for example, note that \( x + x + x + x + x \) is the same as \( 5x \). Students should extend this type of understanding to \( 5(x + 1) \) meaning five groups of \( (x + 1) \) added together, thus simplifying to \( 5x + 5 \). For each of the properties of arithmetic, students should connect concrete understanding to abstract representations. |
| Construct viable arguments and critique the reasoning of others | Students should be able to explain and justify any step in simplifying an expression or solving an equation first in words and/or pictures and then with properties of arithmetic. Further, students should be able to evaluate the work of others to determine the accuracy of that work and then construct a logical argument for their thinking that involves properties of arithmetic. |
| Model with mathematics | Students should be able to model situations with expressions and equations AND they should be able to translate expressions and equations to contexts. Further, they should be able to interchange models with abstract representations. |
| Attend to precision | Students demonstrate precision by using correct terminology and symbols when working with expressions and equations. Students use precision in calculation by checking the reasonableness of their answers and making adjustments accordingly. |
| Look for and make use of structure | Using models, students develop an understanding of algebraic structures. For example, in section 3.2 students should understand the structure of an equation like \( 3x + 4 = 5 \) as meaning the same thing as \( 3x = 1 \) or \( x = 1/3 \) when it is “reduced.” Another example, in section 3.3, students will write equations showing that a 20% increase is the original amount plus 0.2 of the original amount or 1.2 of the original amount. They will note that in an expression that can be written in multiple ways: \( x + 0.2x \) or \( x(1 + 0.2) \). |
| Use appropriate tools strategically | Students demonstrate their ability to select and use the most appropriate tool (paper/pencil, manipulatives, and calculators) while solving problems. Students should recognize that the most powerful tool they possess is their ability to reason and make sense of problems. |
| Look for and express regularity in repeated reasoning | Students will study patterns throughout this chapter and connect them to both their intuitive understanding and the properties of arithmetic. Students will move to expressing patterns they notice to general forms. |
3.0 Anchor Problem: Decorating a Patio.

Below are the first three steps of a pattern; on the next page we will investigate steps 10 and “x.” Each square in the pattern is one unit.

**Step 1**
How many units are in this step of the pattern? Write down at least two methods that you could use to quickly “add up” the units.

Method 1:

Method 2:

Method 3:

Method 4:

**Step 2**
How many units are in this step of the pattern? Write down at least two methods that you could use to quickly “add up” the units.

Method 1:

Method 2:

Method 3:

Method 4:

**Step 3**
How many units are in this step of the pattern? Write down at least two methods that you could use to quickly “add up” the units.

Method 1:

Method 2:

Method 3:

Method 4:
Step 10
Draw what you think step 10 would look like.

How many units are in this step of the pattern? Write down at least two methods that you could use to quickly “add up” the units.

Method 1:

Method 2:

Method 3:

Method 4:

Step x

Use this space to draw a model to help you think about the pattern.

How could you adapt the methods you used above to find the number of units for any pattern.

Method 1:

Method 2:

Method 3:
Section 3.1: Communicate Numeric Ideas and Contexts Using Mathematical Expressions and Equations

Section Overview: This section contains a brief review of numerical expressions. Students will recognize that a variety of expressions can represent the same situation. Models are encouraged to help students connect properties of arithmetic in working with numeric expressions to working with algebraic expressions. These models, particularly algebra tiles, aid students in the transition to abstract thinking and representation. Students extend knowledge of mathematical properties (commutative property, associative property, etc.) from purely numerical problems to expressions and equations. The distributive property is emphasized and factoring, “backwards distribution,” is introduced. Work on naming and formally defining properties appears at the beginning of the section so that students can attend to precision as they verbalize their thinking when working with expressions. Through the section, students should be encouraged to explain their logic and critique the logic of others.

Concepts and Skills to be Mastered (from standards)

By the end of this section, students should be able to:
1. Recognize and explain the meaning of a given expression and its component parts.
2. Recognize that different forms of an expression may reveal different attributes of the context.
3. Combine like terms with rational coefficients.
4. Use the Distributive Property to expand and factor linear expressions with rational numbers.
5. Recognize properties of arithmetic and use them in justifying work when manipulating expressions.
6. Write numeric and algebraic expressions to represent contexts.
3.1a Class Activity: Naming Properties of Arithmetic

Naming Properties of Arithmetic
In mathematics, there are things called “properties;” you may think of them as “rules.” There is nothing new in the properties discussed in this section. Everything you expect to work still works. We are just giving vocabulary to what you’ve been doing so that when you construct a mathematical argument, you’ll be able to use language with precision.

Commutative Property
Examples:
The sum of both $8 + 7 + 2$ and $8 + 2 + 7$ is 17.
The sum of both $13 + 14 + (-3)$ and $13 + (-3) + 14$ is 24.
The product of both $\left(\frac{1}{2}\right)(7)(8)$ and $\left(\frac{1}{2}\right)(8)(7)$ is 28.
The product of both $(9)(\frac{-1}{3})$ and $(\frac{-1}{3})(9)(7)$ is $-21$.

The word “commute” means “to travel” or “change.” It’s most often used in association with a location. For example, we say people commute to work.

Which pairs of expressions are equivalent?

<table>
<thead>
<tr>
<th>1. equivalent</th>
<th>2. not equivalent</th>
</tr>
</thead>
<tbody>
<tr>
<td>$12 + 4$</td>
<td>$9.8 - 3.4$</td>
</tr>
<tr>
<td>$4 + 12$</td>
<td>$3.4 - 9.8$</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>3. not equivalent</th>
<th>4. equivalent</th>
</tr>
</thead>
<tbody>
<tr>
<td>$12 - 4$</td>
<td>$5 \cdot 4$</td>
</tr>
<tr>
<td>$4 - 12$ Ask students if there is a way to commute with subtraction. $\rightarrow 12 + (-4) = (-4) + 12$</td>
<td>$4 \cdot 5$</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>5. equivalent</th>
<th>6. not equivalent</th>
</tr>
</thead>
<tbody>
<tr>
<td>$3 \cdot 0.9$</td>
<td>$18 \div 6$</td>
</tr>
<tr>
<td>$0.9 \cdot 3$</td>
<td>$6 \div 18$</td>
</tr>
</tbody>
</table>

7. What pattern are you noticing? You can change the order of addition and multiplication and get an equivalent expression, but you cannot do that with subtraction and division.

8. In your own words, what is the Commutative Property?
$a + b = b + a; ab = ba; $ Addition and multiplication are commutative (you can change the order of addition or multiplication) without affecting the result.
**Associative Property**

The word “associate” means “partner” or “connect.” Most often we use the word to describe groups. For example, if a person goes to Eastmont Middle School and not Indian Hills Middle School, we would say that person is **associated** with Eastmont Middle School.

Examples:
The sum of both $3 + (17 + 4) + 16$ and $(3 + 17) + (4 + 16)$ is 40
The product of both $(2\times5)(3)$ and $(2)(5\times3)$ is 30

For each of the following pairs of expressions, the operations are the same, but the constants have been associated (grouped) in different ways. Determine if the pairs are equivalent; be able to justify your answer. **Be sure to use the order of operations.**

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>9.</td>
<td>10.</td>
</tr>
<tr>
<td>$(12 + 4) + 6$ equivalent</td>
<td>$(12 - 4) - 3$ not equivalent</td>
</tr>
<tr>
<td>$12 + (4 + 6)$</td>
<td>$12 - (4 - 3)$ Ask how both could be written to make them equivalent → $12 + (-4 + -3) = (12 + -4) + -3$</td>
</tr>
<tr>
<td>11.</td>
<td>12.</td>
</tr>
<tr>
<td>$(3 + 5) + 7.4$ equivalent</td>
<td>$(20.9 - 8) - 2$ not equivalent</td>
</tr>
<tr>
<td>$3 + (5 + 7.4)$</td>
<td>$20.9 - (8 - 2)$</td>
</tr>
<tr>
<td>$(5 \cdot 4) \cdot \left(\frac{1}{2}\right)$ equivalent</td>
<td>$(18 \div 6) \div 3$ not equivalent</td>
</tr>
<tr>
<td>$5 \cdot \left(4 \cdot \frac{1}{2}\right)$</td>
<td>$18 \div (6 \div 3)$ Ask how both could be written to make them equivalent → $(18 \cdot \frac{1}{6}) \cdot (\frac{1}{3}) = 18 \cdot (\frac{1}{6} \cdot (\frac{1}{3}))$</td>
</tr>
<tr>
<td>15.</td>
<td>16.</td>
</tr>
<tr>
<td>$(6 \cdot 2) \cdot 5$ equivalent</td>
<td>$(24 \div 12) \div 3$ not equivalent</td>
</tr>
<tr>
<td>$6 \cdot (2 \cdot 5)$</td>
<td>$24 \div (12 \div 3)$</td>
</tr>
</tbody>
</table>

17. What patterns do you notice about the problems that were given?
Addition and multiplication can be grouped in different ways and still give the same result. This is not true of subtraction and division.

18. In your own words, what is the Associative Property? $(a + b) + c = a + (b + c)$; $(ab)c = a(bc)$; Addition and multiplication are associative (you can change the grouping), but subtraction and division are not.
Identity Property

The word “identity” has to do with “sameness.” We use this word when we recognize the sameness between things. For example, you might say that a Halloween costume cannot really hide a person’s true identity.

Above we defined the Associative and Commutative Properties for both addition and multiplication. We need to do the same thing for the Identity Property.

19. What do you think the Identity Property for Addition should mean? Answers will vary. Look for something like “doesn’t change the identity of the expression.”

20. Give examples of what you mean:

21. In your own words, what is the Identity Property of Addition? $a + 0 = a$; you can add “0” to anything and it won’t change the expression.

22. What do you think the Identity Property for Multiplication should mean? Answers will vary. Look for something like “doesn’t change the identity of the expression.”

23. Give examples of what you mean:

24. In your own words, what is the Identity Property of Multiplication: $a(1) = a$; you can multiply anything by 1 and it won’t change the expression.
Inverse Properties

The word “inverse” means “opposite” or “reverse.” You might say, forward is the *inverse* of backward. There is an inverse for both addition and multiplication.

25. What do you think should be the additive inverse of 3? 
   -3

26. What do you think would be the additive inverse of –3? 
   3

27. What do you think would be the multiplicative inverse of 3? 
   \( \frac{1}{3} \)

28. What do you think would be the multiplicative inverse of \( \frac{1}{3} \)? 
   3

29. In your own words, what is the Inverse Property of Addition? \( a + (-a) = 0 \); discuss how this property is related to the additive identity

30. In your own words, what is Inverse Property of Multiplication? 
   \( a(1/a) = 1 \) for \( a \neq 0 \); discuss how this property is related to the multiplicative identity.
## Generalizing Properties

### Properties of Mathematics:

Spiral Review

1. Order the following rational numbers from least to greatest. \( \frac{27}{3}, 6.5, \frac{18}{3}, 0.99 \)
   
   \( 0.99, \frac{18}{3}, 6.5, \frac{27}{3} \)

2. What is the opposite of \(-19\)?  
   \(+19\) or \(19\)

3. What is 10% of 90? Use bar model to help you.  
   \(9\)

4. Without using a calculator, determine which fraction is bigger in each pair. Justify your answer with a picture and words.
   
   a. \(\frac{1}{3}\) or \(\frac{1}{2}\)  
      
      1 piece out of a pie cut into 2 will be bigger than 1 piece out of a pie cut into 3 pieces

   b. \(\frac{3}{7}\) or \(\frac{3}{5}\)

5. Solve: \(\frac{3}{4} + \frac{1}{8} = \frac{7}{8}\)
3.1b Class Activity: Translating Contexts to Numeric Expressions (Equivalent Expressions)

Review from Chapter 1: In 1.3, you drew models and then wrote arithmetic expressions to find fraction and percent decreases and increases. For example:

1.3a Class Activity 1a was a percent decrease of the original amount:

Larry has a piece of rope that’s 12 feet long.

He cuts off 25% of the rope off. How long is the rope now?

To write an expression for the length of the rope with the portion cut off, we can think about it two ways:

<table>
<thead>
<tr>
<th>... we started with the 12 foot section and then subtracted 25% of 12:</th>
<th>...we can recognize that when we remove 25% of the rope, we’re left with 75% (100% – 25%) of the rope:</th>
</tr>
</thead>
<tbody>
<tr>
<td>12 – (0.25)12</td>
<td>(1 – 0.25)12</td>
</tr>
<tr>
<td>12 – 3</td>
<td>(0.75)12</td>
</tr>
<tr>
<td>9 feet of rope</td>
<td>9 feet of rope</td>
</tr>
</tbody>
</table>

1.3 Class Activity 1b was a percent increase of the original amount:

Joe has a rope that is 25% longer than Larry’s 12-foot long rope. How long is Joe’s rope?

To write an expression for the percent increase we think about it two ways:

<table>
<thead>
<tr>
<th>...we start with the 12 foot rope and then add 25% of 12 to the length:</th>
<th>...we recognize that a 25% increase means we start with the whole length and then add 25%; thus we now have 125% (100% + 25%) of the original:</th>
</tr>
</thead>
<tbody>
<tr>
<td>12 + (0.25) 12</td>
<td>(1 + 0.25) 12</td>
</tr>
<tr>
<td>12 + 3</td>
<td>(1.25) 12</td>
</tr>
<tr>
<td>15 feet of rope</td>
<td>15 feet of rope</td>
</tr>
</tbody>
</table>

In both examples above, we wrote equivalent expressions. What do you think it means to say “two expressions are equivalent”? 
For each context: a) write a numeric expression, b) justify an estimate for the answer, and then c) find the answer (a calculator will be helpful for these.)

1) The tree in Maria’s yard has grown 27% in the last two years. If it was originally 12 feet tall two years ago, how tall is it now? 12(1) + 12(0.27) or 12(1.27) = 15.24 ft; estimate: 27% ≈ 25% and 25% of 12 is 3 so the tree should be about 15 feet tall.

2) Paulo can run a marathon in four hours and 20 minutes. If he’s able to cut 18% off his time, how long will it take him to run a marathon? 260(0.82) or 260(1) – 260(0.18) or (1 – 0.18)(260) = 213.2 min

3) Joe’s snowboard is 140 centimeters; Carly’s is 14% longer. How long is Carly’s snowboard?

140(1.14) or 140(1) + 140(0.14) or (1 + 0.14)(140) = 159.6 cm

4) Write a context involving a percent for the following numeric expression: 300 + 0.27(300)

Student responses will vary.

5) Write a context involving a percent for the following numeric expression: 0.78(144)

Student responses will vary.

6) Juan, Calista, and Angelo are working together on the following percent problem:

There are 400 fish in a large tank. Write a numeric expression to find the number of fish in the tank if the number of fish increases by 23%.

Juan says the expression is 1.23(400); Calista says it’s 400 + 0.23; and Angelo says it’s (1 + 0.23)(400). Are they all correct? Explain why each expression is correct or incorrect.

7) Below are 4 expressions, circle the three that are equivalent.

a) \( (1 – 0.35)(423) \)

b) \( (0.65)(423) \)

c) \( 423 – 0.35(423) \)

d) \( 423 – 0.35 \)
For each of the five contexts below, there are four numeric expressions offered. Look at each expression offered and determine whether or not it is appropriate for the given context. Explain why the expression “works” or “doesn’t work.”

8. Josh made five 3-pointers and four 2-pointers at his basketball game. Write a numeric expression to represent how many points Josh scored.

<table>
<thead>
<tr>
<th>Expression</th>
<th>Evaluate</th>
<th>Does it work?</th>
<th>Why or Why Not?</th>
</tr>
</thead>
<tbody>
<tr>
<td>a. $3 + 3 + 3 + 3 + 2 + 2 + 2 + 2$</td>
<td>23</td>
<td>Yes</td>
<td>Each basket is added together, giving the total.</td>
</tr>
<tr>
<td>b. $5 + 3 + 4 + 2$</td>
<td>14</td>
<td>No</td>
<td>$5 + 3$ is not an accurate interpretation of “five 3-pointers”</td>
</tr>
<tr>
<td>c. $(5 + 3)(4 + 2)$</td>
<td>48</td>
<td>No</td>
<td>$5 + 3$ is not an accurate interpretation of “five 3-pointers”</td>
</tr>
<tr>
<td>d. $5(3) + 4(2)$</td>
<td>23</td>
<td>Yes</td>
<td>It is the same as A. $5(3)$ means 5 groups of 3 as above. $4(2)$ means 4 groups of 2.</td>
</tr>
</tbody>
</table>

9. Carlo bought two apples for $0.30 each and three pounds of cherries for $1.75 a pound. Write a numeric expression for how much money Carlo spent.

<table>
<thead>
<tr>
<th>Expression</th>
<th>Evaluate</th>
<th>Does it work?</th>
<th>Why or Why Not?</th>
</tr>
</thead>
<tbody>
<tr>
<td>a. $2(1.75) + 3(0.30)$</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>b. $2(0.30) + 3(1.75)$</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>c. $0.30 + 0.30 + 1.75 + 1.75 + 1.75$</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>d. $(2 + 3)(0.30 + 1.75)$</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

10. Inez bought two apples for $0.30 each and three oranges for $0.30 each. Write a numeric expression for how much money Inez spent.

<table>
<thead>
<tr>
<th>Expression</th>
<th>Evaluate</th>
<th>Does it work?</th>
<th>Why or Why Not?</th>
</tr>
</thead>
<tbody>
<tr>
<td>a. $(0.30 + 0.30 + 0.30) + (0.30 + 0.30)$</td>
<td>$1.50</td>
<td>Yes</td>
<td>Added each purchase individually.</td>
</tr>
<tr>
<td>b. $3(0.30) + 2(0.30)$</td>
<td>$1.50</td>
<td>Yes</td>
<td>This uses multiplication instead of repeated addition.</td>
</tr>
<tr>
<td>c. $5(0.30)$</td>
<td>$1.50</td>
<td>Yes</td>
<td>This expression works because the cost for each fruit is always $0.30.</td>
</tr>
<tr>
<td>d. $0.60 + 0.90$</td>
<td>$1.50</td>
<td>Yes</td>
<td>This sums the total cost of apples and the total cost of oranges</td>
</tr>
</tbody>
</table>
11. Aunt Nancy gave her favorite niece 3 dollars, 3 dimes, and 3 pennies. Write a numeric expression for how much money Nancy gave her favorite niece.

<table>
<thead>
<tr>
<th>Expression</th>
<th>Evaluate</th>
<th>Does it work?</th>
<th>Why or Why Not?</th>
</tr>
</thead>
<tbody>
<tr>
<td>a. 3(1.00) + 3(0.10) + 3(0.01)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>b. 3(1.00 + 0.10 + 0.01)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>c. 3 + 1.00 + 0.10 + 0.01</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>d. 3.00 + 0.30 + 0.03</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

12. Grandma Nancy has 20 chocolate and 25 red velvet cupcakes. She gives each of her three grandchildren 1/3 of her cupcakes. Write an expression for how many cupcakes she gave each grandchild.

<table>
<thead>
<tr>
<th>Expression</th>
<th>Evaluate</th>
<th>Does it work?</th>
<th>Why or Why Not?</th>
</tr>
</thead>
<tbody>
<tr>
<td>a. 3(20 + 25)</td>
<td>135</td>
<td>No</td>
<td>This triples the number of cupcakes Grandma has.</td>
</tr>
<tr>
<td>b. (1/3)(20 + 25)</td>
<td>15</td>
<td>Yes</td>
<td>This combines the cupcakes and gives 1/3 to each grandchild.</td>
</tr>
<tr>
<td>c. (20 + 25)/3</td>
<td>15</td>
<td>Yes</td>
<td>This combines the cupcakes and then divides the amount into 3 equal portions.</td>
</tr>
<tr>
<td>d. (1/3)(20) + (1/3)(25)</td>
<td>15</td>
<td>Yes</td>
<td>This gives 1/3 of each kind of cupcake to each grandchild.</td>
</tr>
</tbody>
</table>

13. Mila bought a sweater for $25 and a pair of pants for $40. She had a 25% off coupon for her purchase, write an expression for how much Mila spent.

<table>
<thead>
<tr>
<th>Expression</th>
<th>Evaluate</th>
<th>Does it work?</th>
<th>Why or Why Not?</th>
</tr>
</thead>
<tbody>
<tr>
<td>a. 0.25(25 + 40)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>b. 0.75(25 + 40)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>c. 0.75(25) + 0.75(40)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>d. (3/4)(25 + 40)</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
14. Paul bought two sandwiches for $5 each, a drink for $3.00, and a candy bar for $1.00. He had a 20% off coupon for the purchase. Write an expression to how much Paul spent for the food.

<table>
<thead>
<tr>
<th>Expression</th>
<th>Evaluate</th>
<th>Does it work?</th>
<th>Why or Why Not?</th>
</tr>
</thead>
<tbody>
<tr>
<td>a. 0.20(2(5) + 3 + 1)</td>
<td>$2.80</td>
<td>No</td>
<td>This is 20% of the total amount (what he saved), not 20% off.</td>
</tr>
<tr>
<td>b. 0.80(2(5) + 3 + 1)</td>
<td>$11.20</td>
<td>Yes</td>
<td>20% discount is the same as paying 80% of the price of all items.</td>
</tr>
<tr>
<td>c. 0.80(2(5)) + 3 + 1</td>
<td>$12</td>
<td>No</td>
<td>You’re only taking 20% off the sandwiches</td>
</tr>
<tr>
<td>d. (4/5)(2(5) + 3 + 1)</td>
<td>$11.20</td>
<td>Yes</td>
<td>80% of an amount is the same as 4/5 of the amount</td>
</tr>
</tbody>
</table>

For each context: a) write a numeric expression for the context and b) answer the question.

15. Aunt Nancy gave each of her four nieces two dollars, 1 dime, and 3 pennies. How much money did Nancy give away? Answers will vary: 4(2(1) + 1(0.10) + 3(0.01)) $8.52

16. Uncle Aaron gave 8 dimes, 2 nickels, and 20 pennies to each of his two nephews. How much money did he give away?

17. I bought 2 toy cars for $1.25 each and 3 toy trucks for $1.70 each. How much did I spend? Answers will vary: 2(1.25) + 3(1.70) $7.60

18. The football team scored 1 touchdown, 3 field goals, and no extra points. How many points did they score in all? Hint: a touchdown is worth 6 points, a field goal worth 3, and an extra point worth one. Answers will vary: 1(6) + 3(3) 15 points

19. I had $12. Then I spent $2.15 a day for 5 days in a row. How much money do I have now?

20. I earned $6. Then I bought 4 candy bars for $0.75 each. How much money do I have left? Answers will vary: 6 – 4(0.75) $3

21. Cara bought two candles for $3 each and three books for $7 each. She had a 25% off her entire purchase coupon. How much did she spend on her purchases?

22. Mona and Teresa worked together to make $118 selling phone covers and $354 fixing computers. If they split the money evenly between the two of them, how much money did they each make? (1/2)(118 + 354) $236

23. Dora bought three pair of shoes for $15 each and two pair of shorts for $20 each. If she had a 15% off coupon for her entire purchase, how much money did she spend?
3.1b Homework: Translating Contexts to Numerical Expressions

For each context: a) write a numeric expression, b) justify an estimate for the answer, and then c) find the answer (a calculator will be helpful for these).

1. Camila is allowed 1100 text messages a month on her plan. When she got her September bill it showed she had gone over the allowed text messages by 38%. How many text messages did she send in September?
   \[1100(1 + 0.38) = 1100(1.38) = 1518\]

2. Leona made $62,400 in her first year as an engineer at IM Flash in Lehi. She’s up for review and stands to get a 12.5% pay raise if her review is favorable. If she gets the pay raise, what will she be earning?

For each of the five contexts below, there are four numeric expressions offered. Look at each expression offered and determine whether or not it is appropriate for the given context. Explain why the expression “works” or “doesn’t work.”

3. I bought two toy cars for $5 each and three toy trucks for $7 each. Write a numeric expression for how much was spent.

<table>
<thead>
<tr>
<th>Expression</th>
<th>Evaluate</th>
<th>Does it work?</th>
<th>Why or Why Not?</th>
</tr>
</thead>
<tbody>
<tr>
<td>a. 2(5) + 3(7)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>b. 2(3) + 5(7)</td>
<td>$41</td>
<td>No</td>
<td>This expression pairs the wrong quantities together.</td>
</tr>
<tr>
<td>c. (2 + 3)(5 + 7)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>d. (2 + 3) + (5 + 7)</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

4. The football team scored three touchdowns, two field goals, and two extra points. Write a numeric expression for how many points were scored in all. (Hint: a touchdown is 6 points, a field goal is 3 points, and an extra point is 1 point)

<table>
<thead>
<tr>
<th>Expression</th>
<th>Evaluate</th>
<th>Does it work?</th>
<th>Why or Why Not?</th>
</tr>
</thead>
<tbody>
<tr>
<td>a. 3(6) + 2(3) + 2(1)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>b. 6 + 6 + 6 + 3 + 3 + 1 + 1</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>c. (6 + 6 + 6) + (3 + 3) + (1 + 1)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>d. 18 + 6 + 2</td>
<td>26</td>
<td>Yes</td>
<td>This is the same as a) or c) after the first step of simplification.</td>
</tr>
</tbody>
</table>
5. I earned $6. Then I bought 4 candy bars for $0.50 each. Write a numeric expression for how much money I have left.

<table>
<thead>
<tr>
<th>Expression</th>
<th>Evaluate</th>
<th>Does it work?</th>
<th>Why or Why Not?</th>
</tr>
</thead>
<tbody>
<tr>
<td>a. $6 - 0.50 - 0.50 - 0.50 - 0.50$</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>b. $6 - 4(0.50)$</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>c. $6 - (0.50 - 0.50 - 0.50 - 0.50)$</td>
<td>$4$</td>
<td>Yes</td>
<td>This subtracts the sum of 0.50 four times.</td>
</tr>
<tr>
<td>d. $6 - (0.50 + 0.50 + 0.50 + 0.50)$</td>
<td>$4$</td>
<td>Yes</td>
<td></td>
</tr>
</tbody>
</table>

6. I earned $5. Then I spent $1 a day for 2 days in a row. Write a numeric expression for how much money I have now.

<table>
<thead>
<tr>
<th>Expression</th>
<th>Evaluate</th>
<th>Does it work?</th>
<th>Why or Why Not?</th>
</tr>
</thead>
<tbody>
<tr>
<td>a. $5 - 1 + 1$</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>b. $5 - 1 - 1$</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>c. $5 - (1 - 1)$</td>
<td>$5$</td>
<td>No</td>
<td>We need to subtract the sum of the two dollars.</td>
</tr>
<tr>
<td>d. $5 - (1 + 1)$</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

7. Uncle Aaron bought three books for $12 each and a candy bar for $1.35. He had a coupon for 20% off his purchase. Write an expression for how much he spent.

<table>
<thead>
<tr>
<th>Expression</th>
<th>Evaluate</th>
<th>Does it work?</th>
<th>Why or Why Not?</th>
</tr>
</thead>
<tbody>
<tr>
<td>a. $0.80(3)(12) + 1.35$</td>
<td>$30.15$</td>
<td>No</td>
<td>80% is applied only to the cost of the books.</td>
</tr>
<tr>
<td>b. $0.08(3(12) + 1.35)$</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>c. $0.80(3(12) + 1.35)$</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>d. $(4/5)(3(12) + 1.35)$</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
8. Leah bought four glue sticks for $0.50 each and three small cans of paint for $2.25 each at the craft store. She had a 25% off the entire purchase coupon she applied. Write an expression for how much Leah spent.

<table>
<thead>
<tr>
<th>Expression</th>
<th>Evaluate</th>
<th>Does it work?</th>
<th>Why or Why Not?</th>
</tr>
</thead>
<tbody>
<tr>
<td>a. 4(0.50) + 3(2.25) – 0.25</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>b. 0.25(4(0.50) + 3(2.25))</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>c. 0.75(4(0.50) + 3(2.25))</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>d. 0.75(4(0.50)) + 0.75(3(2.25))</td>
<td>$5.56 (rounded)</td>
<td>Yes</td>
<td>This is taking 75% of each part.</td>
</tr>
<tr>
<td>e. 3/4 (4(0.50) + 3(2.25))</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Write an expression of your own for each problem. Then evaluate the expression to solve the problem. There are various accurate expressions for these problems. They should each result in the value given.

9. Josh made ten 3-pointers and a 2-pointer at his basketball game. How many points did he score?

10. I bought five apples for $0.30 each and 5 oranges for $0.30 each. How much money did I spend?

5(0.30) + 5(0.30) = $3.00

11. I bought two apples for $0.50 each and four oranges for $0.25 each. When I got to the cash register, I got a 50% discount. How much money did I spend?

12. At the store I bought three sweaters for $25 each and two pair of pants for $30 each. I had a coupon for 25% off the total purchase. How much money did I spend?

0.75(3(25) + 2(30)) = $101.25

Write a context similar to the ones in # 8 – 12 for each numeric expression given. Answers will vary.

13. 10 – 3(0.75) – 2(0.50)

14. 3(2 + 5)

15. (1/2)(2(60) + 3(10))

16. (0.80)(25 + 15)
Spiral Review

1. Locate each of the following on the line below:   \( A = 4 \)   \( B = -4 \)   \( C = -15 \)   \( D = 7 \)   \( E = 18 \)   \( F = -19 \)

   \[ \begin{array}{cccccccc}
   & F & C & B & A & D & E \\
   \hline
   -20 & -15 & -10 & -5 & 0 & 5 & 10 & 15 & 20
   \end{array} \]

2. For the model below, write a numeric expression and then create a context.

   \[ 14 + (-17) = -3 \]

3. Simplify: \( 2 \frac{3}{5} - 1 \frac{1}{2} \)   \( \frac{1}{10} \)

4. \( 18 \div (6 \div 3) = 6 \)

5. \( 3 \div \frac{3}{4} = 4 \)
3.1c Class Activity: Algebraic Expressions

Write two different numeric expressions for the context below:

Maria bought 5 apples for $0.35 each. 
$5(0.35) = 0.35 + 0.35 + 0.35 + 0.35 + 0.35$

How would the expression change if she spent $0.40 on each apple? 
$5(0.40) = 0.40 + 0.40 + 0.40 + 0.40 + 0.40$

What if you didn’t know how much each apple cost, how could you write an expression? 
$5x$ or $x + x + x + x + x$

For each context, four algebraic expressions are offered. Make a conjecture about the correctness of the expression. Then, evaluate it for the given value, and explain why the expression did or didn’t work for the given context.

1. Ryan bought 3 CDs for $x$ dollars each and a DVD for $15. Write an expression of how much money Ryan spent.

<table>
<thead>
<tr>
<th>Expression</th>
<th>Correct expression?</th>
<th>Evaluate $x = 7$</th>
<th>Did it work?</th>
<th>Why or why not?</th>
</tr>
</thead>
<tbody>
<tr>
<td>a. $3 + x + 15$</td>
<td>-No-</td>
<td>$25$</td>
<td>No</td>
<td>“$3 + x$” does not translate “3 CDs for $x$ dollars”.</td>
</tr>
<tr>
<td>b. $15x + 3$</td>
<td>-No-</td>
<td>$108$</td>
<td>No</td>
<td>“$15x$” does not represent “a DVD for $15$”</td>
</tr>
<tr>
<td>c. $15 + x + x + x$</td>
<td>-Yes-</td>
<td>$36$</td>
<td>Yes</td>
<td>There is 15 for the DVD, then three CDs, each represented with an $x$.</td>
</tr>
<tr>
<td>d. $3x + 15$</td>
<td>-Yes-</td>
<td>$36$</td>
<td>Yes</td>
<td>This uses multiplication to make expression C more concise.</td>
</tr>
</tbody>
</table>

2. I started with 12 jellybeans. Sam ate 3 jellybeans and then Cyle ate $y$ jellybeans. Write an expression for how many jellybeans were left.

<table>
<thead>
<tr>
<th>Expression</th>
<th>Correct expression?</th>
<th>Evaluate $y = 6$</th>
<th>Did it work?</th>
<th>Why or why not?</th>
</tr>
</thead>
<tbody>
<tr>
<td>a. $12 - 3 - y$</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>b. $12 - (3 - y)$</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>c. $12 - (3 + y)$</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>d. $9 - y$</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
3. Kim bought a binder for $5 and 4 notebooks for \( n \) dollars each. She received a 30% discount on the items. Write an expression for how much she spent.

<table>
<thead>
<tr>
<th>Expression</th>
<th>Do you think it will work?</th>
<th>Evaluate (use ( n = 3 ))</th>
<th>Did it work?</th>
<th>Why or why not?</th>
</tr>
</thead>
<tbody>
<tr>
<td>a. 0.70(5 + 4 + n)</td>
<td>---</td>
<td>$8.40</td>
<td>No</td>
<td>“4 + n” does not accurately represent “4 notebooks for ( n ) dollars each”.</td>
</tr>
<tr>
<td>b. 0.70(4n + 5)</td>
<td>---</td>
<td>$11.90</td>
<td>Yes</td>
<td>This sums 4 times the cost of a notebook with the other item and then 70% of that amount.</td>
</tr>
<tr>
<td>c. 0.70(5n + 4n)</td>
<td>---</td>
<td>$18.90</td>
<td>No</td>
<td>This is 70% of the sum of $5n AND 4n. We only need to multiply the 4 by ( n ).</td>
</tr>
<tr>
<td>d. 0.30(4n + 5)</td>
<td>---</td>
<td>$5.10</td>
<td>No</td>
<td>The 4n + 5 is correct, but 30% is the discount, not the amount spent.</td>
</tr>
</tbody>
</table>

For each context below, draw a model for the situation, label all parts, and then write an expression that answers the question. The first exercise is done for you.

**Example:** Jill bought 12 apples. Jan bought \( x \) more apples than Jill. Write an expression to show how many apples Jan bought.

Jan bought 12 + \( x \) apples. This is not the only way to model these problems.

![Model](image)

4. Josh won 12 tickets. Evan won \( p \) tickets fewer than Josh. Write an expression to represent the number of tickets Evan won.

\[ 12 - p \]

It is helpful to ask “who won more tickets?” or “Did Josh get more or less tickets than Evan?”
5. Tim is 3 years younger than his brother. If his brother is $y$ years old, write an expression to represent Tim’s age. $y - 3$

Brother is $y$ years old
Tim is younger $\leftarrow$ 3 years younger $\rightarrow$

6. Carol washed 8 windows. Mila washed $w$ windows fewer than Carol. If both Carol and Mila earn $2 for each window they wash, write an expression to represent how much money Mila earned for washing windows.

$$2(8 - w) \text{ or } 16 - 2w$$

7. Jan bought $a$ more apples than Jill. Jill bought 4 apples. Each apple costs $0.10. Write an expression to show how much money Jan spent on apples.

$$0.10(4 + a)$$

For the following models, write a context (with question) and algebraic expression that fits the given model.

8.  

\begin{center}
\begin{tabular}{c}
\textbf{Billy’s height is 66”} \\
\hline
\end{tabular}
\end{center}

\[ y \]

\begin{center}
\textbf{Joe’s height is $y$ inches more than Billy}
\end{center}

66 + $y$. Answers will vary: Billy and Joe measured themselves to see who was taller. Billy was 66” tall and Joey was $y$ inches taller than Billy. Write an expression to represent Joe’s height.

9.  

\begin{center}
\begin{tabular}{c}
\textbf{A shirt normally costs $20} \\
\hline
\end{tabular}
\end{center}

\[ d \]

\begin{center}
\textbf{The sale price is for $d$ dollars off.}
\end{center}

20 – $d$. Answers will vary: A shirt normally costs $20, but the store is taking $d$ dollars off the original price. Write an expression for the sale price of the shirt.

Create a context and draw a model for the following algebraic expressions.

10. $r + 15$

Answers will vary: Taylor has 15 more toys than Zachary does. Zachary has $r$ toys. Write an expression for the number of toys Taylor has.

Zachary has $r$ toys

Taylor has 15 more toys.
11. \(1.75(x - 10)\)

Answers will vary: Sarah bought 10 fewer pears than Peter. Peter bought \(x\) pears and each pear cost \$1.75. How much did Sarah spend? Alternative: During the first week of work Sarah earned \(x\) dollars and Peter earned \$10 less than Sarah. The next week, Peter earned 75% more money. Write an expression for how much money Peter earned the second week of work.

Note that the same model can be used for the second context.

<table>
<thead>
<tr>
<th>Peter bought (x) pears</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sarah bought (x - 10) pears</td>
</tr>
</tbody>
</table>

Sarah bought 10 fewer pears than Peter.

For each context involving a percent increase or decrease, write an algebraic expression for the questions. Use a model if desired:

12. Tanya had \(x\) number of marbles in her bag. She lost 25% of them when they spilled out by accident. Write an expression for the number of marbles she now has.

\[0.75x\text{ or }1x - 0.25x\]

13. Bruno has an \(m\) inch vertical jump. He wants to increases it by 30%. Write an expression for how high he will be able to jump if he’s able to increase his vertical jump by 30%.

\[1.3m\text{ or }1m + 0.3m\]

14. It costs Guillermo \(d\) dollars to produce smartphone covers to sell. He wants to sell them for 45% more than it costs him to make them. Write an expression for how much he should sell the smartphone covers.

\[1.45d\text{ or }1d + 0.45d\]

15. Juliana is training for a race. If she was able to reduce her time \(t\) by 17%, write an expression for how much time it will take to her run the race now.

\[0.83t\text{ or }1t - 0.17t\]
3.1c Homework: Algebraic Expressions

Read each context. Make a conjecture about which expressions will work for the context given. Evaluate the expression for a given value. Explain why the expression did or didn’t work for the given context.

1. Bob bought 5 books for $x$ dollars each and a DVD for $12. Write an expression for how much money Bob spent.

<table>
<thead>
<tr>
<th>Expression</th>
<th>Do you think it will work?</th>
<th>Evaluate (use $x = 5$)</th>
<th>Did it work?</th>
<th>Why or why not?</th>
</tr>
</thead>
<tbody>
<tr>
<td>a. $5 + x + 12$</td>
<td>---</td>
<td>$22$</td>
<td>No</td>
<td>“$5 + x$” does not accurately represent “5 books for $x$ dollars each.”</td>
</tr>
<tr>
<td>b. $5(x)12$</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>c. $x + x + x + x + x + 12$</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>d. $5x + 12$</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

2. Jim won 30 tickets. Evan won $y$ tickets fewer than Jim did. Write an expression for the number of tickets Evan won.

<table>
<thead>
<tr>
<th>Expression</th>
<th>Do you think it will work?</th>
<th>Evaluate (use $y = 6$)</th>
<th>Did it work?</th>
<th>Why or why not?</th>
</tr>
</thead>
<tbody>
<tr>
<td>a. $30 - y$</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>b. $y - 30$</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>c. $y + 30$</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>d. $30 \div y$</td>
<td></td>
<td>5 tickets</td>
<td>No</td>
<td>The difference between their amounts is absolute; we must subtract.</td>
</tr>
</tbody>
</table>
Draw a model and write an expression for each context.

3. I did 4 more problems than Manuel. If I did \( p \) problems, write an expression for how many did Manuel did.

4. I bought \( x \) pair of shoes for $25 each and 2 pairs of socks for $3 each. Write an expression for how much money I spent.

\[
\$25x + 2(\$3)
\]

5. I bought \( m \) gallons of milk for $3.59 each and a carton of eggs for $2.24. Write an expression for how much money I spent.

6. Paul bought \( s \) sodas for $1.25 each and chips for $1.75. Write an expression for how much money Paul spent.

7. Roberto and Francisco went to the basketball game. Each bought a drink for \( d \) dollars and nachos for \( n \) dollars. Write an expression for the amount of money they spent all together.

For the following models, come up with a context and an expression that represents the model.

8.

Mike’s weight is 100 lbs.

\[
y
\]

Jacob’s weight

9.

Potatoes normally cost $12

\[
p
\]

Sale price of potatoes
Create a model and write a context for the following expressions.

Answers will vary.

10. \(2(q + 4)\)  
11. \(5 - k\)

For each context involving a percent increase or decrease, write an algebraic expression for the questions. Use a model if desired:

12. Marcia ran \(m\) miles on Monday. On Tuesday, she ran 18\% farther than she ran on Monday. Write an expression for how far Marcia ran on Tuesday.

\[1.18m \text{ or } 1m + 0.18m\]

13. Jorge needs to reduce his expenses by 35\%. If he currently spends \(q\) dollars a month, write an expression for how much he will be spending once he reduces his expenses.

14. Ruth normally orders \(p\) pounds of flour for her bakery every week. She’s decided she needs to increase her order by 22\%. Write an expression for how many pounds of flour she will now be ordering.

Spiral Review

1. Which number is larger? Justify your answer. \(-4.03\) or \(-4.3\) \(-4.03\); it is further to the right on the real line.

2. Use long division to show how you can convert this fraction to a decimal and then a percent \(\frac{2}{9}\) \(0.\overline{2} ; \, 22.\overline{2}\%\)

3. Which number is greater: \(-5.101\) or \(-5.11\)? Justify. \(-5.101\)
3.1c Additional Practice

For each problem, draw a model, write out what the unknown stands for, and then write an expression modeling the situation.

1. Marina has $12 more than Brandon. Represent how much money Marina has.
   
   
   $b$ is the amount of money Brandon has. Then Marina has $b + 12$ dollars.

2. Conner is three times as old as Jackson. Represent Conner’s age.

3. Diane earned $23 less than Chris. Represent how much Diane earned.

4. Juan worked 8 hours for a certain amount of money per hour. Represent how much Juan earned.

5. Martin spent 2/3 of the money in his savings account on a new car. Represent the amount of money Martin spent on a new car.

6. Brianne had $47 dollars. She spent $15 on a new necklace and some money on a bracelet. Represent the amount of money Brianne has now.

7. For 5 days Lydia studied math for a certain amount of time and read for 15 minutes each day. Represent the total amount of time Lydia studied and read over the 5-day period.

   $m$ is amount of time she studied math each day. This was repeated for 5 days so $5( m + 15 )$. 
8. Carlos spent $8 on lunch, some money on a drink and $4 on ice cream. Represent how much money Carlos spent.

9. Nalini has $26 dollars less than Hugo. Represent the amount of money Nalini has.

10. Bruno ran four times as far as Milo. Represent the distance Bruno ran.

11. Christina earned $420. She spent some of her earnings on her phone bill and spent $100 on new clothes. Represent the amount of money Christina now has.
   \[ p \text{ is the amount spent on the phone bill. } $420 - p - $100 \text{ or } $320 - p. \]

12. Camille has 4 bags of candy. Each bag has 3 snicker bars and some hard candy. Represent the amount of candy Camille has.

13. Heather spent \( \frac{1}{4} \) of the money in her savings account on a new cell phone. Represent the amount of money Heather spent on the new cell phone.
   \[ a \text{ is the amount in her account. She spent } \frac{1}{4} \text{ of this or } \left( \frac{1}{4} \right) \times a \text{ or } (1/4)a \text{ or } a/4 \text{ on the cell phone. Discuss these various representations with the class.} \]

14. Miguel is 8 years older than Cristo. Represent Miguel’s age.
3.1d Class Activity: Simplifying Algebraic Expressions with Models

In using Algebra tiles, every variable is represented by a rectangle, positive or negative and every integer is represented by a square, positive or negative.

### Key for Tiles:

- \(1\) = 1
- \(x\) = \(x\)
- \(−1\) = −1
- \(−x\) = −\(x\)

Attention will have to be paid to: \(a − (−b) = a + b\) and \(a − b = a + (−b)\). For example, #1 can be expressed as \(x − 2\) or \(x + −2\); take time to discuss this. For problems #10 through 18, have students create the model in more than one way (e.g. \(2x + 3\) can be modeled with \(5x + −3x + 6 + −3\)).

### Write an expression for what you see and then write the expression in simplest form.

<table>
<thead>
<tr>
<th>Example:</th>
<th>Example</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>−1 −1 −1 −1 −1</td>
<td>(x) 1 1</td>
<td>−1 −1</td>
</tr>
<tr>
<td>1 1 1 1 1</td>
<td>(−x)</td>
<td>(−x)</td>
</tr>
<tr>
<td>−5 + 4</td>
<td>(x)</td>
<td>(x)</td>
</tr>
<tr>
<td>−1</td>
<td>(−x)</td>
<td>(x)</td>
</tr>
<tr>
<td>(2x − x + 4) or (2x + −x + 4) or (x + −x + x + 4) or (x + 4)</td>
<td>(x)</td>
<td>(x)</td>
</tr>
<tr>
<td>(x − 2) or (x + (−2)) talk about these two different ways to write the expression. This is an extension of what was discussed in Chapter 2; remind students that (a − b = a + (−b)) and (a − (−b) = a + b).</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

- \(−x\) or \(−x\) or \(-4x + 2x\) or \(−2x\) or \(−2x + x + −2\) or \(−x + (−2)\) or \(−x − 2\) or \(−3 + 2 + −2x + 3x\) or \(x + (−1)\) or \(x − 1\)
Using algebra tiles, draw two different models or write two different expressions that can be simplified to the following expressions.

<p>| | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>5. $x + 6$</td>
<td>6. $-3x + -2$</td>
<td>7. $4x - 1$</td>
</tr>
</tbody>
</table>

How many ways are there to model each of the expressions above? Justify. Discuss other possible representations (zero pairs in the representations).

Simplify each expression. In #10 remind students again that $x - 2$ is the same as $x + -2$.

<p>| | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>8. $2x + 1 + x$</td>
<td>9. $3x + 4 + (-2)$ $3x + 2$</td>
<td>10. $2x + x - 2 + 3$ $3x + 1$</td>
</tr>
</tbody>
</table>

Throughout exercises, point out that you are changing the order of the terms, using the commutative property, or grouping on addition (using subtract is add the opposite), using the associative property, but the value of the expression is not changing.

<p>| | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>11. $-3x + 1 + -x$ $-4x + 1$</td>
<td>12. $2x + -3 + -2x$ $-3$</td>
<td>13. $-x + 3 + 4x$ $3x + 3$</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>---</td>
<td>---</td>
<td>---</td>
</tr>
<tr>
<td>14.</td>
<td>$-2x + 4 + x - 7$</td>
<td>$-x - 3$ or $-x + (-3)$</td>
</tr>
<tr>
<td>15.</td>
<td>$4x - 3 + 2 - 2x$</td>
<td>$2x - 1$</td>
</tr>
<tr>
<td>16.</td>
<td>$-4x - 1 + 3x + 2 - x$</td>
<td>$-2x + 1$</td>
</tr>
<tr>
<td>17.</td>
<td>$x + x + x + x$</td>
<td>$4x$</td>
</tr>
<tr>
<td>18.</td>
<td>$x - x - x - x$</td>
<td>$-2x$</td>
</tr>
<tr>
<td>19.</td>
<td>$-x - x - x - x$</td>
<td>$-4x$</td>
</tr>
<tr>
<td></td>
<td>Look at # 17, #18 and #19, note the differences.</td>
<td></td>
</tr>
<tr>
<td>20.</td>
<td>$3 - 2x + x - 5$</td>
<td>$-x - 2$ or $-x + (-2)$</td>
</tr>
<tr>
<td>21.</td>
<td>$4 - 2 - 4x - 2$</td>
<td>$-4x$</td>
</tr>
<tr>
<td>22.</td>
<td>$2x - x - 3 + 5$</td>
<td>$x + 2$</td>
</tr>
</tbody>
</table>
3.1d Homework: Simplifying Algebraic Expressions with Models

Use the key below to interpret or draw the algebraic expressions in your homework.

| Key for Tiles: | 1 = 1 | x = x | −1 = −1 | x− = −x |

Write an expression for what you see, and then simplify if possible. The first one is done for you.

1. 

\[ -3 + 2 + -2x + 3x, \text{ simplifies to} \]

\[ -1 + x \text{ or } x + -1 \text{ or } x - 1 \]

2. 

\[ 2x - 3 - x + 2x, \text{ simplifies to} \]

\[ 3x - 3 \text{ or } 3x + (-3) \]

3. 

\[ 3 - 4x + 2x, \text{ simplifies to} \]

\[ 2x + 3 \]
Simplify the following expressions. If needed, sketch a model in the space provided.

<p>| | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>7.</td>
<td>(2x + 4 - x)</td>
<td></td>
</tr>
<tr>
<td>8.</td>
<td>(x - 5 + 3x)</td>
<td></td>
</tr>
<tr>
<td>9.</td>
<td>(2x - 3 + 5) (2x + 2)</td>
<td></td>
</tr>
<tr>
<td>10.</td>
<td>(3x + 2 - 2x)</td>
<td></td>
</tr>
<tr>
<td>11.</td>
<td>(2x + 1 + 3 - 5)</td>
<td></td>
</tr>
<tr>
<td>12.</td>
<td>(\text{not simplified, model needed}) (\text{not simplified, model needed})</td>
<td></td>
</tr>
<tr>
<td>13.</td>
<td>(\text{not simplified, model needed}) (\text{not simplified, model needed})</td>
<td></td>
</tr>
<tr>
<td>14.</td>
<td>(5x - 3 - 4 + x)</td>
<td></td>
</tr>
<tr>
<td>15.</td>
<td>(\text{not simplified, model needed}) (\text{not simplified, model needed})</td>
<td></td>
</tr>
<tr>
<td>16.</td>
<td>(x + 4 - 3x - 7)</td>
<td></td>
</tr>
<tr>
<td>17.</td>
<td>(\text{not simplified, model needed}) (\text{not simplified, model needed})</td>
<td></td>
</tr>
<tr>
<td>18.</td>
<td>(4x - 3 - 7x + 4) (\text{not simplified, model needed})</td>
<td></td>
</tr>
</tbody>
</table>
Spiral Review

1. Mark has $16 more than Becca. Represent how much money Mark has.
   If \( b \) is the amount of money Becca has, then Mark has \( b + 16 \) dollars.

2. What property is shown?
   \[ 8 + 7 + 2 \text{ and } 8 + 2 + 7 \]  commutative
   \[ 18 + 0 \text{ and } 0 + 18 \]  identity property of addition

3. Find: \( \frac{3}{5} + \frac{2}{3} = \frac{19}{15} \text{ or } 1 \frac{4}{15} \)

4. Find: \( -4 + -7 = -11 \)

5. Find: \( -3 - 8 = -11 \)
3.1e Class Activity: More Simplifying Algebraic Expressions

Activity 1:
Miguel saw the following two expressions:

\[ 17 + 4 + 3 + 16 \quad 43 - 8 - 3 + 28 \]

He immediately knew the sum of the first group is 40 and the sum of the second set is 60. How do you think he quickly simplified the expressions in his head?

Help students recognize that *commuting* terms make simplifying easier: \( 17 + 3 + 4 + 16 = 20 + 20 + 40 \) and \( 43 + (-8) + (-3) + 28 = 43 + (-3) + 28 + (-8) = 40 + 20 = 60 \). Emphasize again that the *commutative property* of addition allows us to change the order of addition.

Activity 2:
Abby has 3 turtles, 4 fish, a dog and 2 cats. Nia has 2 turtles, 2 fish, and 3 dogs.
Mr. Garcia asks them, “how many pets do you two have all together?”

Students might first say, “Abby and Nia have a total of 17 animals.” Push them to provide a more precise answer. Then students might say, “Abby and Nia have 5 turtles, 6 fish, 4 dogs and 2 cats.” Emphasize that when adding (joining) we put together “like” items. To add emphasis, you might say out loud, “‘2 fish plus 3 fish is 5 fish,’ but when I say, ‘2 fish plus 3 dogs…’ I can’t add them because they are not the same ‘units.’ ”

The best I can say is that I have 5 animals.”

Simplify the following expression with the Key provided below.

\[ x + y + 3x - 4y + 2 \]
\[ 4x + (-3y) + 2 \]

Justify your work:

*Key for Tiles:*

\[ \begin{array}{c|c|c}
1 & x & y \\
-1 & -x & -y
\end{array} \]

Explain how you would simplify:

\[ 5x - 4 - 3x + 4y - z + 3z \]
\[ 2x + 4y + 2z - 4 \]

Again emphasize units. Point out that “\( x \),” “\( y \)” and “\( z \)” are different from each other, thus we cannot join them with addition.
For #1-16, model each expression (draw Algebra Tiles representations of the variables and numbers). Then simplify each expression.

1. \(8x + 2x + 2y + 7y\) \(10x + 9y\) 
2. \(3z + 2x + x\) \(3z + 3x\)

3. \(5x - 9x + 2w - w\) \(-4x + w\) 
4. \(-6 + 4x + 9 - 2x + 6t - 2t\) \(3 + 2x + 4t\)

5. \(-3 + 3x + 11 - 5x - 2k - k\) \(-2x + 8 - 3k\) 
6. \(9x - 12 + 12 - 9x\) \(0\)

7. \(1 + x + 5x - 2 + 4k - 7k\) \(6x - 1 - 3k\) 
8. \(-4x - 5x + 12m - 2m + 6q - 10q\) \(-9x + 10m - 4q\)
Your friend is struggling to understand what it means when the directions say “simplify the expression.” What can you tell your friend to help him? Answers will vary. Discuss “simplify” vs. “evaluate” vs. “solve” and “expression” vs. “equation”. Also discuss why we simplify—when does it help and when is it easier to not simplify? You might refer back to Activity 2 above.

Your friend is also having trouble with expressions like problems #5 and #8 above. He’s unsure what to do about the “−.” What might you say to help him? Discuss $a - b = a + (-b)$; changing all subtract to “add the opposite” then allows us to use the commutative and associateive properties of addition.

Simplify each. Remind students about the work reviewing fractions in chapter 2. You may want to draw models for some of these. Note that $(1/2)x$ is merely half of an $x$. Thus if one draws a representation of $(1/2)x + (1/4)x$ they will see that joining the images gives $(3/4)x$

10. $\frac{2}{3}x + x + \frac{3}{4} - \frac{1}{4}$

$$\frac{5}{3}x + \frac{1}{2}$$

12. $\frac{5}{3}x + \frac{4}{5} - \frac{2}{3}x - \frac{3}{5}$

$\frac{13}{4}m + \frac{11}{4}y$

16. $-5 + \frac{1}{2}x - \frac{1}{5}y - \frac{2}{10}y + \frac{3}{4}x - 7$

$$\frac{5}{4}x - \frac{2}{5}y - 12$$
3.1e Homework: More Simplifying Algebraic Expressions

For #1-16 model each expression, using Algebra Tiles if necessary. Then simplify each expression, combining like terms.

1. \(5x + 3x + 5y\) \(8x + 5y\)
2. \(1 + 3x + x\)

3. \(3x - 5x + 4y + 3y\) \(-2x + 7y\)
4. \(7m - 2x - 9m + 4x\)

5. \(-4x - 5 + 2x\) \(-2x - 5\) or \(-2x + (-5)\)
6. \(5y - 4x + 5x + 10y\)

7. \(-4x - 5m + x + 7x - 12m\)
   \(4x - 17m\) or \(4x + (-17m)\)
8. \(x - 6x + 14y + 8y - 2x\)

9. \(2x + x + 2y + x + 1\)
   \(4x + 2y + 1\)
10. \(x + 3y + x + 2 + y + 1\)
    \(4x + 2y + 1\)

11. \(\frac{2}{3}t + \frac{2}{3}t + \frac{1}{6} + \frac{2}{3}\)
    \(\frac{4}{3}t + \frac{5}{6}\)
12. \(\frac{5}{6}x + \frac{1}{6}x - \frac{2}{3}x + \frac{1}{2}y + \frac{1}{3}y\)

13. \(-2x + y - 3y + y + x\)
    \(-x - y\) or \(-x + (-y)\)
14. \(\frac{3}{2}y + \frac{5}{2}y - \frac{1}{2}x + \frac{1}{2}\)

15. \(5x - y + 2 - 4x + 2y + x + 2\)
    \(2x + y + 4\)
16. \(\frac{1}{2}x + \frac{1}{3}x + \frac{1}{4}y + \frac{1}{6}y + \frac{1}{5}z - \frac{2}{5}z\)
3.1f Class Activity: Vocabulary for Simplifying Expressions

In groups of 2 or 3 students, consider the following expressions: a) \(2x + 5 + 3y\), b) \(2x + 5 + 3x\), and c) \(2x + 5x + 3x\). How are these expressions similar? How are they different?

Students will note that a) cannot be simplified any further, b) can be simplified to two terms and c) can be simplified to one term. They may also note that the three are algebraic expressions (none are strictly numeric). Have them explain why some of the expressions can be simplified but others not.

Parts of an Algebraic Expression: Use the diagrams to create definitions for the following vocabulary words. Be prepared to discuss your definitions with the class.

<table>
<thead>
<tr>
<th>Terms</th>
<th>Constants</th>
</tr>
</thead>
<tbody>
<tr>
<td>(x - 4 + 2y + 3 - 5y)</td>
<td>(x - 4 + 2y + 3 - 5y)</td>
</tr>
<tr>
<td>There are five terms in this expression. The terms are (x), (-4), (2y), (3), and (-5y)</td>
<td>The constants are (-4) and (3). (Recall that subtracting is like adding a negative number.)</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Coefficients</th>
<th>Like Terms</th>
</tr>
</thead>
<tbody>
<tr>
<td>(x - 4 + 2y + 3 - 5y)</td>
<td>(x - 4 + 2y + 3 - 5y)</td>
</tr>
<tr>
<td>The coefficients are 1, 2, and (-5)</td>
<td>2(y) and (-5y) are like terms. (-4) and (3) are also like terms.</td>
</tr>
</tbody>
</table>

Suggestions for what should be included in their definitions are below.

Terms: a part of an algebraic expression, either a product of numbers and variable(s) or simply a number. In each of the examples above, terms are separated by addition (when view subtract as add the opposite).

Constant: a “stand alone” number, not a variable

Coefficient: the numeric factor of the term

Like Terms: terms with the same variable(s)

2. Identify the terms, constants, coefficients, and like terms in each algebraic expression.

<table>
<thead>
<tr>
<th>Expression</th>
<th>Terms</th>
<th>Constants</th>
<th>Coefficients</th>
<th>Like Terms</th>
</tr>
</thead>
<tbody>
<tr>
<td>(4x - x + 2y - 3)</td>
<td>(4x, -x, 2y, -3)</td>
<td>(-3)</td>
<td>(4, -1, 2)</td>
<td>(4x, -x)</td>
</tr>
<tr>
<td>(3z + 2z + 4z - 1)</td>
<td>(3z, 2z, 4z, -1)</td>
<td>(-1)</td>
<td>(3, 2, 4)</td>
<td>(3z, 2z, 4z)</td>
</tr>
<tr>
<td>(2 + 3b - 5a - b)</td>
<td>(2, 3b, -5a, -b)</td>
<td>(2)</td>
<td>(3, -5, -1)</td>
<td>(3b, -b)</td>
</tr>
<tr>
<td>(a + b - c + d)</td>
<td>(a, b, -c, d)</td>
<td>none</td>
<td>(1, 1, -1, 1)</td>
<td>None</td>
</tr>
</tbody>
</table>
3. Identify the terms, constants, coefficients, and like terms in each algebraic expression.

<table>
<thead>
<tr>
<th>Expression</th>
<th>Terms</th>
<th>Constants</th>
<th>Coefficients</th>
<th>Like Terms</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>a.</strong> $2y + 5y - 6x + 2$</td>
<td>$2y, 5y, -6x, 2$</td>
<td>2</td>
<td>2, 5, -6</td>
<td>$2y, 5y$</td>
</tr>
<tr>
<td><strong>b.</strong> $-3x + 2x - (2/3)$</td>
<td>$-3x, 2x, -(2/3)$</td>
<td>$-(2/3)$</td>
<td>-3, 2</td>
<td>$-3x, 2x$</td>
</tr>
<tr>
<td><strong>c.</strong> $\frac{4}{5} p + \frac{1}{5} - 3h + j$</td>
<td>$\frac{4}{5}, \frac{1}{5}, -3h, j$</td>
<td>$1/5$</td>
<td>$4/5, 3, 1$</td>
<td>None</td>
</tr>
<tr>
<td><strong>d.</strong> $0.3x - 1.7 + 1.2 + 4.4y + 3.6y$</td>
<td>$0.3x, -1.7, 1.2, 4.4y, 3.6y$</td>
<td>-1.7, 1.2</td>
<td>$0.3, 4.4, 3.6$</td>
<td>$-1.7 &amp; 1.2; 4.4y &amp; 3.6y$</td>
</tr>
</tbody>
</table>

Simplify the above expressions. Remember to show your work.

a. $7y - 6x + 2$

b. $-x - \frac{2}{3}$

c. $\frac{4}{5} p + \frac{1}{5} - 3h + j$

d. $0.3x - 0.5 + 8y$
3.1f Homework: Solidifying Expressions

Matching: Write the letter of the equivalent expression on the line.

1. ___ 3x – 5x  a) \(-8a\)
2. ___ 4a – 12a  b) \(2x – 6\)
3. ___ 3x + 5x  c) \(-x + y\)
4. ___ 16a + a  d) \(9x – 4y\)
5. f___ 2x – 2y + y  e) \(-2x\)
6. ___ 2x – 2 – 4  f) \(2x – y\)
7. ___ x – y + 2x  g) \(x + y\)
8. ___ \(-y + 2y – x\)  h) \(3x – y\)
9. g___ 5x + 4y – 3x – x + 3y – 6y  i) \(17a\)
10. d___ 4x + 3y + 5x – 7y  j) \(8x\)

Simplify each expression. For exercises #11 – 16, also list all the coefficients.

11. \(13b – 9b\)
12. \(22x + 19x\)
13. \(44y – 12y\)
14. \(6a + 4a – 2b\)  \(6, 4, -2; 10a – 2b\)
15. \(16b – 4b + 2\)
16. \(\frac{2}{3}a – \frac{3}{4}a\)
17. \(3.4 – 21.4x – 3.4y + 2.2\)
18. \(\frac{12}{20}b – \frac{1}{4}b + \frac{3}{4}\)
19. \(2x + 0.5x – 3y + 4.75y + 9.8\) \(2.5x + 1.75y + 9.8\)
20. \(14w + 9 + 15 – 15w\)
21. \(4m + 6 + 2m – 5\)
22. \(6z – 16z – 9z + 18z + 2\) \(-z + 2\)
23. \(16y – 12y – 20\)
24. \(2x – 2 + 3 + 8x\)
25. \(\frac{2}{3}x + \frac{3}{4}x\)
26. \(11 – u – 14u + 13u\)
27. \(88.5z – 22.4y + 4.04z + 26.3\) \(-22.4y + 92.54z + 26.3\)
28. \(4b – 3 + 2\)
3.1f Additional Practice

Simplify each expression.

1. $2x - y + 5x$
   $7x - y$

2. $5y + x + y$

3. $2y + 8x + 5y - 1$
   $7y + 8x - 1$

4. $10b + 2 - 2b$

5. $8y + x - 5x - y$
   $-4x + 7y$

6. $9x + 2 - 2$

7. $-2x - 6 + 3y + 2x - 3y$
   $-6$

8. $6m + 2n + 10m$

9. $7b - 5 + 2b - 3$
   $9b - 8$

10. $2a - 3 + 5a + 2$

11. $8x + 5 - 7y + 2x$
    $10x - 7y + 5$

12. $4y + 3 - 5y - 7$

13. $6x + 4 - 7x$
    $-x + 4$

14. $2x + 3y - 3x - 9y + 2$

15. $-2b + a + 3b$
    $b + a$

16. $m - 5 + 2 - 3n$

17. $4 + 2r + q$
    $4 + 2r + q$

18. $5h - 3 + 2k - h + k$

19. $5t - 3 - t + 2$ $4t - 1$

20. $c + 2d - 10c + 4$
3.1g Class Activity: Multiplying Groups/Distributive Property

Review:
Show as many different ways to write 50 as you can.

Possible expressions:
10+10+10+10+10 5(0+10), 5(1+9), 5(2+8), ...
5(0)+5(10), 5(1)+5(9), 5(2)+5(8), ... 0+50, 5+45, 10+40, ...

Also make sure to discuss with students the meaning of multiplication: 5(10) means 5 groups of size 10. Examine the different ways to represent a product of 50 below. Explain how each is an accurate representation of 50.

Review:
NUMBER LINE MODELS for MULTIPLICATION (1 dimensional representation of multiplication)

<table>
<thead>
<tr>
<th>5 × 10</th>
<th>10 × 5</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 10 20 30 40 50</td>
<td>0 10 20 30 40 50</td>
</tr>
<tr>
<td>5(3 + 7)</td>
<td>Notice that in the number line to the left, first there are five groups of 3 then there are five groups of 7. This can also be represented as five groups of a length of (3 + 7) or 10.</td>
</tr>
</tbody>
</table>

Activity: On the number line below, show a length of 1 unit. Then make the length of 3 units. You may want to refer back to 2.3a for this discussion. To determine a length of three units, we must first agree on a length of one unit. Once we know how long “one” is, we can choose any point on the line as a starting point and then we can copy our “one” unit 3 times to find a length of 3.

| 0 1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23 24 25 26 27 28 29 30 31 32 33 34 35 36 37 38 39 40 41 42 43 44 45 46 47 48 49 50 |
|-------------------------|-------------------------|
| 0 1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23 24 25 26 27 28 29 30 31 32 33 34 35 36 37 38 39 40 41 42 43 44 45 46 47 48 49 50 |

On the number line below, show a length of \( x \) units. Then make the length of \( 3x \) units.

Discuss with students that a length of “\( x \)” is an unknown length. We simply choose a random point on the line as our starting point and another as the end point and call that length our length \( x \). We then copy that length three times to find a length of \( 3x \). Thus, we can scale \( x \) in any way we want e.g. 2\( x \), 5\( x \), 0.25\( x \), etc.
AREA MODELS for MULTIPLICATION (2 dimensional representation of multiplication)

<table>
<thead>
<tr>
<th></th>
<th>25</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>50</td>
</tr>
</tbody>
</table>

\[2 \times 25\]

<table>
<thead>
<tr>
<th></th>
<th>10</th>
</tr>
</thead>
<tbody>
<tr>
<td>5</td>
<td>50</td>
</tr>
</tbody>
</table>

\[5 \times 10\]

<table>
<thead>
<tr>
<th>3</th>
<th>7</th>
</tr>
</thead>
<tbody>
<tr>
<td>5</td>
<td>15</td>
</tr>
</tbody>
</table>

\[5(3 + 7)\]

Create your own representation of 50:
1. \((1/2)(100)\)
2. \(2.5 \times 20\)
3. \(1 \times 50\)

<table>
<thead>
<tr>
<th></th>
<th>5</th>
<th>5</th>
</tr>
</thead>
<tbody>
<tr>
<td>5</td>
<td>25</td>
<td>25</td>
</tr>
</tbody>
</table>

\[5(5 + 5) \text{ or } 5^2 + 5^2\]

Can you draw an area model representation of \(3x\)?

Discuss this model with students. One dimension has a length of 3, and the other a length of \(x\). In the model, we can see that there are 3 groups of rectangles that measure 1 by \(x\). Remind student of the algebra tiles used earlier in the chapter. Point out that \(3x\) is the same as (equivalent to) \(x + x + x\). It is important that students clearly distinguish \(3x\) from \(x^3\).
1. Model 5(x + 1) and then simplify. Justify your steps.

\[ 5x + 5 \]

Students might do a one or two dimensional model (see below) OR write FIVE groups of \((x + 1)\): e.g. \((x + 1) + (x + 1) + (x + 1) + (x + 1) + (x + 1)\). Then, using the commutative property and associative property, combine like terms.

Students can also use technology to copy \(x + 1\) and then paste it 5 times.

<table>
<thead>
<tr>
<th>(x)</th>
<th>1</th>
</tr>
</thead>
<tbody>
<tr>
<td>(x)</td>
<td>1</td>
</tr>
<tr>
<td>(x)</td>
<td>1</td>
</tr>
<tr>
<td>(x)</td>
<td>1</td>
</tr>
<tr>
<td>(x)</td>
<td>1</td>
</tr>
</tbody>
</table>

2. Model 4(x – 2) and simplify.

\[ 4x – 8 \]

Take time to discuss the different ways that this expression can be written (see below).

An alternative is to have students write \((x – 2)\) or \((x + (–2))\) four times. This way they will see the four “\(x\)’s” and four “\(–2\)’s”.

Write 4(x – 2) in three different ways. \(4x – 8\); \(4x + (–8)\); \(4(x) – 4(2)\); \(4(x) + 4(–2)\)

What does the number in front of the parentheses tell you about the grouping? The number tells you how many groups of the amount in the “( )” there are.
3. a. Explain what $3(2x - 5)$ means, then simplify. $3(2x - 5)$ means three groups of $(2x - 5)$, which simplifies to $6x - 15$. Students might also write $3(2x + -5)$

b. Write $3(2x - 5)$ in three different ways. $3(2x) - 3(5); 6x - 15; 6x + (-15); (2x - 5) + (2x - 5) + (2x - 5)$

How can you use what we’ve learned about integers and what we know about writing expressions with parentheses to rewrite expressions that have “−” in the groupings?

$a(b - c) = a(b + (-c)) = ab - ac$

Explanations will vary: There are $a$ groups of $(b - c)$ which gives you $a$ groups of $b$ and $a$ groups of $-c$.

Write the expression below in an equivalent form. If necessary, draw a model.

<p>| | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>4. $3(x + 2)$</td>
<td>$3x + 6$</td>
<td>5. $2(3x + 5)$</td>
</tr>
<tr>
<td>7. $4(3x - 1)$</td>
<td>$12x + (-4)$ or $12x - 4$</td>
<td>8. $2(3 + x)$</td>
</tr>
<tr>
<td>10. $\frac{1}{2}(4x + 6)$</td>
<td>$2x + 3$</td>
<td>11. $\frac{3}{4}(2x - 5)$</td>
</tr>
</tbody>
</table>

In sixth grade, you talked about order of operations, what is the order of operations and how is it related to what you’ve been doing above?

PEMDAS—four things that should be discussed here: 1) generally, we simplify groupings first if we can. For example, $5(3 + 7)$ is the same as $5(10)$. This is more efficient than saying $5(3) + 5(7)$, finding the products and then adding—$15 + 35$ is $50$. 2) The distributive property is particularly helpful when we cannot simplify a grouping. For example, in the expression $3(x + 2)$, we cannot combine $x$ and $2$, so the only way to rewrite the expression is to distribute the $3$. In this context we understand “distribute” to mean there are $3$ groups of $(x + 2)$. This allows us to reorder our terms and combine like terms. 3) Using $a - b = a + (-b)$ allows us to change order when there is subtraction. 4) “Simplifying” means that we write a expression in a manner that makes it more clear for our purposes. There will be times the expression $3(x + 2)$ is more simple for our purposes than the equivalent $3x + 6$.

3.1g Homework: Multiplying Groups/Distributive Property

Simplify each of the following. Draw a model or explain the meaning of the expression to justify your answer.

1. $5(x + 1)$  $5x + 5$
2. $2(3x + 2)$
3. $4(x + 3)$
4. $2(3x - 1)$  $6x - 2$ or $6x + (-2)$
5. $3(2x - 3)$
6. $5(x - 1)$
7. $\frac{1}{3}(3x + 12)$  $x + 4$
8. $\frac{3}{4}(5x - 8)$
9. $-\frac{2}{5}(4x - 7)$  $-\frac{8}{5}x + \frac{14}{5}$
10. $0.25(4x - 8)$
11. $0.6(-2x + 5)$
12. $-2.4(1.5x - 0.9)$  $-3.6x + 2.16$

The expressions $2(5x - 3)$ can be written and $10x - 6$ OR $10x + (-6)$.
Write the following expressions in two different ways as the example shows:

15. $4(3x - 5)$  $12x - 20$ or $12x + (-20)$
16. $2(7x - 3)$
Review: below is a review of modeling multiplication with an array.

Factors: 1, 3
There is one group of 3
Product/Area: 3

Factors: 2, 3
There are two groups of 3
Product/Area: 6

Factors: 3, 3
There are three groups of 3
Product/Area: 9

Use the Key below to practice using a multiplication model. Use phrase \( x \) to second power leads to \( x^2 \).

Factors: 2, 2
Product/Area: 4

Factors: 4, 4
Product/Area: 16

Factors: \( x, x \)
Product/Area: \( x^2 \)

Look at the three models above. What do you think \( 2^2 \) might be called? “two squared” Why? It is a square with side length of 2. What might \( 4^2 \) be called? “four squared” What do you think \( x^2 \) might be called? “\( x \)-squared” Why? Note the difference between \( 4 \times 4, (4^2), 4 + 4, \) and \( 2(4) \).
1. Build the factors for $3(x + 2)$ on your desk. Then build the area model. Draw and label each block below.

What are the factors of the multiplication problem? $3, x + 2$

What is the area? $3x + 6$

What is the product of the multiplication problem? $3x + 6$

Point out that when we multiply using a model, the factors are the dimensions of the rectangle that is created. When students factor, they will create a rectangle with the terms to find factors (dimensions).

2. Build the factors for $3(2x +1)$ on your desk. Then build the area model. Draw and label each block below.

What are the factors of the multiplication problem? $3, 2x +1$

What is the area? $6x + 3$

What is the product of the multiplication problem? $6x + 3$

3. Build the factors for $2(x + 4)$. Build the area and draw.

What is the area or product? $2x + 8$

What are the factors? $2$ and $x + 4$.

4. Build the factors for $x(x + 3)$. Build the area and draw.

What is the area or product? $x^2 + 3x$

What are the factors? $x$ and $x + 3$
5. Build the factors for \( x(2x + 5) \). Build the area and draw.

What is the area or product? \( 2x^2 + 5x \)

What are dimensions or factors? \( x \) and \( 2x + 5 \)

Example: Factor \( 2x + 4 \)
We create a rectangle with the terms:
two “\( x \)” blocks and four “1” blocks.
Notice that the dimensions of the rectangle are
2 by \( (x + 2) \)
\( 2(x + 2) = 2x + 4 \)
\( 2(x + 2) \) is the factored form of \( 2x + 4 \)

6. Factor \( 6x + 3 \) by creating a rectangle to see its dimensions.

What are the dimensions (factors) \( 3, (2x + 1) \)

Width: \( 2x + 1 \) Height: \( 3 \)

What is the area (product) of the rectangle? \( 6x + 3 \)

Write \( 6x + 3 \) in factored form: \( 3(2x + 1) \)

Also note that a rectangle can be described by its width and height, sometimes also referred to as length and width. Since a rectangle retains all of its properties even if it is rotated 90°, we can talk about the dimensions of a rectangle being length and width OR width and height. Both are acceptable common uses of ways to describe a rectangle.

Remind students that factoring is the opposite of the distributive property. It might be helpful to draw this on the board.
\[
3(2x + 1) = 3(2x) + 3(1) = 6x + 3
\]
Distributing -------------->
<--------------------------Factoring
Draw a model to factor each of the following.

7) 10x + 5

Dimensions of Rectangle: 5 and 2x + 1
or Greatest Common Factor: 5
10x + 5 in factored form: 5(2x + 1)

8) 3x + 12

Dimensions of Rectangle: 3 and x + 4
or Greatest Common Factor: 3
3x + 12 in factored form: 3(x + 4)

9) 5x + 10

Dimensions of Rectangle: 5 and x + 2
or Greatest Common Factor: 5
5x + 10 in factored form: 5(x + 2)

10) 10x + 5

Dimensions of Rectangle: 5 and 2x + 1
or Greatest Common Factor: 5
10x + 5 in factored form: 5(2x + 1)

11) 3x + 12

Dimensions of Rectangle: 3 and x + 4
or Greatest Common Factor: 3
3x + 12 in factored form: 3(x + 4)

12) 5x + 10

Dimensions of Rectangle: 5 and x + 2
or Greatest Common Factor: 5
5x + 10 in factored form: 5(x + 2)

13) 6x + 2

Dimensions of Rectangle: 2 and 3x + 1
or Greatest Common Factor: 2
6x + 2 in factored form: 2(3x + 1)

14) x + 4

Dimensions of Rectangle: 1 and x + 4
or Greatest Common Factor: 1
x + 4 in factored form: x + 4 or 1(x + 4)

15) x^2 + 3x

Dimensions of Rectangle: x and x + 3
or Greatest Common Factor x
2x^2 + 4x in factored form: x(x + 3)
Practice: Write each in factored form. Be ready to justify your answer.

<p>| | | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>16. $30x + 6$</td>
<td>17. $4b + 28$</td>
<td>18. $3m - 15$</td>
<td></td>
</tr>
<tr>
<td>$6(5x + 1)$</td>
<td>$4(b + 7)$</td>
<td>$3(m - 5)$</td>
<td></td>
</tr>
<tr>
<td>19. $4n - 2$</td>
<td>20. $25b - 5$</td>
<td>21. $4x - 8$</td>
<td></td>
</tr>
<tr>
<td>$2(2n - 1)$</td>
<td>$5(5b - 1)$</td>
<td>$4(x - 2)$</td>
<td></td>
</tr>
</tbody>
</table>

Look at problems #16, 17, and 21. How else might these expressions be factored? #12 could be written as $2(15x + 3)$. Discuss “greatest common factor.” Both $2(15x + 3)$ and $6(5x + 1)$ are factored forms of $30x + 6$. [We could even factor it as $7((30/7)x + 6/7).$] However, 6 is the greatest common factor so the convention is to say $6(5x + 1)$ is factored completely because the greatest common factor was pulled out of each term. “Factoring” and “simplifying” are ways to write expressions to meet our purpose. For example, in 8th grade a student may be working with the linear equation $y = 25x - 5$ and want to know what the $x$ intercept is. In that case, she might factor out the 25: $y = 25(x - 0.2)$ to reveal the $x$ intercept.

Write the following in factored form. The first one is done for you.

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>$\frac{2}{3}x + \frac{5}{3}$</td>
<td>$\frac{3}{2}x + \frac{7}{2}$</td>
</tr>
<tr>
<td>Notice $\frac{1}{3}$ is a factor of both the coefficient and the constant.</td>
<td>$\frac{3}{2} = \frac{1}{2} \cdot 3$ and $\frac{7}{2} = \frac{1}{2} \cdot 7$ so $\frac{3}{2}x + \frac{7}{2}$ can be written as $\frac{1}{2} \cdot 3x + \frac{1}{2} \cdot 7$ and factored as $\frac{1}{2}(3x + 7)$</td>
</tr>
<tr>
<td>$\frac{2}{3} = \frac{1}{3} \cdot 2$ and $\frac{5}{3} = \frac{1}{3} \cdot 5$ so $\frac{2}{3}x + \frac{5}{3}$ can be written as $\frac{1}{3} \cdot 2x + \frac{1}{3} \cdot 5$ and factored as $\frac{1}{3}(2x + 5)$</td>
<td>$\frac{3}{2}x + \frac{7}{2} = \frac{20}{3}x - \frac{4}{3} = \frac{20}{3}x + \left( -\frac{4}{3} \right)$</td>
</tr>
<tr>
<td>$\frac{20}{3} = \frac{4}{3} \cdot 5x$ and $-\frac{4}{3} = \frac{4}{3} \cdot (-1)$</td>
<td>$\frac{4}{3} \cdot 5x + \frac{4}{3} \cdot (-1)$</td>
</tr>
<tr>
<td>$\frac{4}{3}(5x + (-1))$ or $\frac{4}{3}(5x - 1)$</td>
<td>$\frac{4}{3}(5x + (-1))$ or $\frac{4}{3}(5x - 1)$</td>
</tr>
</tbody>
</table>

<p>| | |</p>
<table>

3.1h Homework: Modeling Backwards Distribution

Write each in factored form. Use a model to justify your answer on problems #1 - 6.

1. \(2x + 4\)  
   \(2(x + 2)\)

2. \(3x + 12\)

3. \(2x + 10\)

4. \(3x + 18\)

5. \(x^2 + 2x\)
   \(x(x + 2)\)

6. \(x^2 + 5x\)

7. \(\frac{4}{7}x + \frac{6}{7}\)

8. \(\frac{2}{3}x - 4\)
   \(\frac{2}{3}(x - 6)\) or \(\frac{2}{3}(x + (-6))\)

9. \(0.6x + 1.5\)
   \(0.3(2x + 5)\) or \(0.6(x + 2.5)\)

Simplify each expression. Justify your answer with words or a model.

10. \(2x + 3x\)

11. \((2x)(3x)\)

12. \(5x - 2x\)

13. \((5x)(-2x)\)
   \(-10x^2\)
3.1i Class Activity: More Simplifying

Review:

What is the opposite of “forward 3 steps”?
Backward 3 steps

What is the opposite of “turn right”
Turn left

What is the opposite of “forward three steps then turn right”?
Backward 3 steps turn left

In math, what symbol do we use that means opposite?
Negative symbol

Using the logic above, what do you think each of the following means?

<table>
<thead>
<tr>
<th>Expression</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>(-x)</td>
<td>the opposite of (x)</td>
</tr>
<tr>
<td>(-x)</td>
<td>the opposite of (x)—note that these first two mean exactly the same thing.</td>
</tr>
<tr>
<td>(-(x+1))</td>
<td>the opposite of (x+1). Talk about taking the opposite of ALL of (x+1). Relate to above. Thus it means (-x-1) or (-x+(-1)). If students build this using models, they may note that it is also the same as (-1-x) or (-1+(-x)).</td>
</tr>
<tr>
<td>(-(1-x))</td>
<td>the opposite of the entire quantity (1-x); (-1+x) or (x+(-1)) or (x-1).</td>
</tr>
</tbody>
</table>

a) Consider the number line below. The location of \(x\) and \((x+1)\) are identified on the line. Locate and label \(-x\) and \(-(x+1)\). \(-x\) is on the opposite side of 0 the same distance from 0 as \(x\). \(-(x+1)\) is also on the opposite side of 0 and the same distance as \(x+1\).

b) Consider the number line below. The location of \((1-x)\) is identified on the line. Locate and label \(-(1-x)\).
What does “–” in front of a set of parentheses tell us? Take the opposite of the “stuff” on the inside of the grouping. We can also think of the value of the quantity as a location on the real line and the “–” in front means we want the quantity on the opposite side of 0, the same distance away from 0.

On the line below the location of the quantity \(x + 1\) is indicated.

c) Locate \(3(x + 1)\)
d) Locate \(-3(x + 1)\)

To find \(3(x + 1)\) we need to measure the length of \(x + 1\) as shown. That is ONE length of \(x + 1\) from 0; to find \(3(x + 1)\) we want three of those lengths from 0. \(-3(x + 1)\) is the same distance from 0, but on the opposite side of 0. Students should make sense of both the 3 and the “–”.

Activity:
Suppose Juanita has $1200 in her savings account and once a week for 5 weeks she withdraws \(x\) dollars for bills and $10 for entertainment. Write an expression for the amount of money she now has in her savings account.
\[
$1200 – 5(x + 10)
\]
Discuss this representation with your students. Talk about both the subtraction and why there is a “+10” inside the grouping.

In groups of 2 or 3 students, simplify each of the following. Be ready to justify your answer.

<p>| | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>1. (4(x + 1))</td>
<td>2. (-(x + 2))</td>
<td>3. (-(3x + 2))</td>
</tr>
<tr>
<td>(4x + 4)</td>
<td>(-x - 2)</td>
<td>(-3x - 2)</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>4. (-2(x + 3))</td>
<td>5. (-3(x - 2))</td>
<td>6. (2(3 - x))</td>
</tr>
<tr>
<td>(-2x - 6)</td>
<td>(-3x + 6)</td>
<td>(6 - 2x)</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>7. (-2(5 - 3x))</td>
<td>8. (-(4 - 3x))</td>
<td>9. (-4(2x + 3))</td>
</tr>
<tr>
<td>(-10 + 6x)</td>
<td>(-4 + 12x)</td>
<td>(-8x - 12)</td>
</tr>
</tbody>
</table>
In groups of 2 or 3 students, simplify the following exercises. Justify your answers.

<table>
<thead>
<tr>
<th>10. (3x + 5 - x + 3(x + 2))</th>
<th>11. (3x + 5 - x - 3(x + 2))</th>
</tr>
</thead>
<tbody>
<tr>
<td>(5x + 11)</td>
<td>(-x - 1) or (-x + (-1))</td>
</tr>
</tbody>
</table>

Compare problems #10 and 11

<table>
<thead>
<tr>
<th>12. (2(x - 1) + 4x - 6 + 2x)</th>
<th>13. (-2(x - 1) + 4x - 6 + 2x)</th>
</tr>
</thead>
<tbody>
<tr>
<td>(8x - 8)</td>
<td>(4x - 4) Compare problems 12 and 13</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>14. (5 + 2(x - 3))</th>
<th>15. (7x - 2(3x + 1))</th>

### 3.1i Homework: More Simplifying

Simplify the following expressions:

<p>| | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>$3(2x + 1)$</td>
<td>2.</td>
</tr>
<tr>
<td></td>
<td>$-6x - 3$</td>
<td></td>
</tr>
<tr>
<td>4.</td>
<td>$-(x + 4)$</td>
<td>5.</td>
</tr>
<tr>
<td></td>
<td>$-x + 4$</td>
<td></td>
</tr>
<tr>
<td>7.</td>
<td>$-2(4x - 3)$</td>
<td>8.</td>
</tr>
<tr>
<td></td>
<td>$-8x + 6$</td>
<td></td>
</tr>
<tr>
<td>10.</td>
<td>$5x + 2(x + 3)$</td>
<td>11.</td>
</tr>
<tr>
<td></td>
<td>$7x + 6$</td>
<td></td>
</tr>
<tr>
<td>13.</td>
<td>$5x - 2(x - 3)$</td>
<td>14.</td>
</tr>
<tr>
<td></td>
<td>$3x + 6$</td>
<td></td>
</tr>
<tr>
<td>16.</td>
<td>$10x - 4 - \frac{7}{2}x - \frac{3}{4}(2x - 3)$</td>
<td>17.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Note the subtle but important differences in problems # 10 – 13.
3.1i Additional Practice: Simplifying

Matching: Write the letter of the equivalent expression on the line

1. _____ 3(x + 6)  
   a) −3x − 3
2. ___i____ 3(x − 6)  
   b) 3x + 18
3. ____ 3(x − 1)  
   c) 2x − 6
4. ____ −3(x + 1)  
   d) −2x − 6
5. ____ 6(x − 3)  
   e) −6x + 18
6. ____ −(6x + 18)  
   f) −x + 6
7. ___e____ −(6x − 18)  
   g) 6x − 18
8. ___f____ (x − 6)(−1)  
   h) −6x − 18
9. ____ (x − 3)2  
   i) 3x − 18
10. ___d____ (x + 3)(−2)  
    j) 3x − 3

Practice: Simplify each expression.

11. 7(x + 3)  
12. 3(y − 3)  
13. 3(k + 4)  
14. \( \frac{2}{3}(3b − 6) \)  
15. 7(y − z)  
16. r(s + t)  
17. 2(3x + 2)  
18. 1.6(2v − 2)  
19. (c − 3)(−1)  
20. 8(x − 8)  
21. 4(1 − 6n)  
22. 9.8(p + 5.2)  
23. −6(1 + 2n)  
24. −\( \frac{1}{2} \)(2t + 6)  
25. −1(4 + k)  
26. −(3x − 6)  
27. 3(5x + 2)  
28. 14(j − 12)  
29. −(6x − 6)  
30. −0.8(0.5 − 0.7x)  
31. −4(6 − 6p)  
32. 0.25(n − 7)  
33. 9(4 − 7m)  
34. −5\left( \frac{m + \frac{1}{3}}{3} \right)  
35. −4(k − 1)  
36. −7(−3n + 2)  
37. (6 − t)(−4)

3.1j Extra Practice: Simplifying Expressions

Simplify:

1. \(-2x + 5y + 2x - 4y - 2z\)  
2. \(7w - 3q - 5 + 8q - 6 - 10w\)  
   \[5q - 3w - 11\]

3. \(3p - 2q + 4p + 4q - 6 - 4\)  
4. \(17.3v - 2.6 + 12.8v - 15.5\)  
   \[30.1v - 18.1\]

5. \(-3c + 6c - 5c + 2d - 4d - 3d\)  
6. \(-\frac{10}{3}y - \frac{10}{4}y - 3\)  
   \[-\frac{35}{6}y - 3\]

7. \(31y + 5x - 4 + 12 - 13x - 23y\)  
8. \(-3.7y + 2.9x - 5.6y + 5x - 4.8x\)  
   \[3.1x - 9.3y\]

9. \(\frac{4}{3}(2x - 5)\)  
10. \(-6.4(5.1 - 2.5y)\)  
   \[16y - 32.64\]

11. \((-8 - 6v)(-\frac{2}{5})\)  
12. \((3 - 5h)(-3)\)  

13. \(\frac{1}{2}(6a - 8)\)  
14. \(-1.8(x - 2y)\)  
   \[-1.8x + 3.6y\]

15. \(-(3x + 6)\)  
16. \(-(-3k - 5)\)  
   \[3k + 5\]

17. \(-(7h + 2k)\)  
18. \(\frac{7}{3}(-x + 5q)\)  
   \[-\frac{7}{3}x + \frac{35}{3}q\]

19. \(3 + 4(2x - 5)\)  
20. \(12 - 6(4 - 2y)\)  
   \[12y - 12\]
21. \(5 + (-8 - 6v)\)  
22. \(4 + (3 - 5h)\) \(-5h + 7\)

23. \(2(6h - 8) + 10\)  
24. \(5y - 1(x - 2y) + 6\) \(-x + 7y + 6\)

25. \(5x - (3x + 6) + 6\)  
26. \(5k - (-3k - 5) + 8\)  
\(8k + 13\)

27. \(4h - (7h + 2k) - 5\)  
28. \(7x - 7(-x + 5q)\)  
\(14x - 35q\)
3.1k Class Activity: Modeling Context with Algebraic Expressions

Look back at the anchor problem at the beginning of the chapter. In particular, look back at your work for step 10 and step \( x \). Your task was to express the number of units at each step of the pattern.

Look at your model and work for step 10. Use it to help you determine how many units the 100th step would contain.

Step 100
Draw a model if necessary for step 100:

- How many units would the 100th step contain? Use your methods for the 10th step to help you determine the units in the 100th step.
  
  Method 1: \( 4(100) \), 4 groups of 100 tiles
  
  Method 2: \( 100(4) \), 100 groups of size 4
  
  Method 3: \( 4(99) + 4 \), the four sides of the pattern plus the 4 in the middle
  
  Method 4: Students might try to count, but they’ll not be able to because of the size.

Step \( x \)
Draw a model if necessary for step \( x \):

- How could you adapt the methods you used before to find the number of units for any pattern.
  
  Method 1: \( 4(x) \), 4 groups of \( x \) units
  
  Method 2: \( x(4) \), \( x \) groups of 4 units
  
  Method 3: \( 4(x – 1) + 4 \), the four sides of the pattern plus the 4 in the middle
  
  Method 4: Students will not be able to “count” because it’s abstract, but they should be able to explain the counting.
In the context above you wrote several expressions for each situation; often there is more than one equivalent way to algebraically model a context. Below are contexts; write two equivalent expressions for each situation. It may be helpful to draw a model. Discus ideas of the associative and commutative properties of addition and multiplication throughout these exercises.

1. Marty and Mac went to the hockey game. Each boy bought a program for 3 dollars and nachos for \( n \) dollars. Write two different expressions that could be used to represent how much money the boys spent altogether.

Throughout the exercises discuss properties as they are used naturally.

\[
2(3 + n) \text{ or } (3 + n) + (3 + n) \quad \text{or} \quad 2 \cdot 3 + 2n \text{ or } (3 + 3) + (n + n)
\]

2. Members of the cooking club would like to learn how to make peach ice cream. There are 14 people in the club. Each member will need to buy 3 peaches and 1 pint of cream to make the ice cream. Peaches cost \( x \) cents each, and a pint of cream costs 45 cents. Write two different expressions that could be used to represent the total cost of ingredients for all 14 members of the club. Simplify each expression.

\[
14(3x + 0.45) \quad \text{or} \quad 14 \cdot 3x + 14(0.45) \quad \text{or} \quad 630 + 42x \quad \text{cents (most likely students will not use cents)}
\]

3. Martin’s grandma gave him a $100 gift certificate to his favorite restaurant. Everyday for four days Martin went to the restaurant and bought a drink for $1.19 and fries for \( f \) dollars. Write two different expressions for how much money Martin has left on his gift certificate.

\[
100 - 4(f + 1.19) \text{ or } 100 - (f + 1.19) - (f + 1.19) - (f + 1.19) \text{ or } 100 - 4f - 4(1.19)
\]

4. Juab Junior High School wants to meet its goal of reading 10,000 books in three months. If 7th grade reads \( x \) number of books every week, 8th grade reads \( y \) number of books every week, and 9th grade reads \( z \) number of books every week, write two different expressions for how many books the school will still need to read after 3 weeks?

\[
10,000 - 3(x + y + z) \text{ or } 10,000 - (x + y + z) - (x + y + z) - (x + y + z) \text{ or } 10,000 - 3x - 3y - 4z
\]

For #5 – 10 sketch a model to help you answer the questions.

5. Leo and Kyle are training for a marathon. Kyle runs 10 fewer miles per week than Leo. Draw a model to help clarify contexts. Discuss what it means for something to be “in terms of” something else.

a. Write an expression to represent the distance Kyle runs in terms of Leo’s miles, \( L \).

\[ L - 10 \]

b. Write an expression to represent the distance Leo runs in terms of Kyle’s miles, \( K \).

\[ K + 10 \]

c. Write an expression to represent the distance Kyle runs in 12 weeks in terms of Leo’s miles.

\[ 12(L - 10) \]

\[ 12(L) - 12(10) \]

\[ 12L - 120 \]

d. Write an expression to represent the distance Leo runs in 12 weeks in terms of Kyle’s miles.

\[ 12(K + 10) \]

\[ 12(K) + 12(10) \]

\[ 12K + 120 \]

\[ \text{Kyle} \quad \leftrightarrow \quad \text{10} \quad \text{Kyle’s distance is 10 miles per week FEWER than Leo’s: } L - 10 \]

\[ \text{Leo} \]

\[ \text{Leo’s distance is 10 miles per week MORE than Kyle’s: } K + 10 \]
6. Harry is five years younger than Sue. Bridger is half as old as Harry. Write two different expressions that could be used to represent Bridger’s age in terms of Sue’s age. Simplify each expression. (Hint: use a variable to represent Sue’s age.)

\[
\frac{s - 5}{2} \quad \frac{1}{2}(s - 5) \quad \frac{s}{2} - 5 \quad \frac{s - 5}{2}
\]

Unit: \(s = \text{Sue's age}\) \(\text{Bridger is } \frac{1}{2}\)
Unit: \(s - 5 = \text{Harry's age}\)

\[
\text{Bridger's age} \quad \text{Harry's age so he is} \quad \frac{(s - 5)}{2} = 0.5(s - 5).
\]

7. Maria earned some money babysitting. She spent \(\frac{1}{2}\) of her babysitting money on a gift for her mother and then put \(\frac{2}{3}\) of the rest into her savings account. Write at least one expression for how much money Maria put into her savings account. (A model is provided below.)

<table>
<thead>
<tr>
<th>½ for gift</th>
<th>SAVINGS</th>
</tr>
</thead>
</table>

Money Maria earned babysitting

Let \(x\) be the amount Maria earned.
Savings: \((\frac{2}{3})((1/2)x)\) or \((\frac{2}{6})x\) or \((\frac{1}{3})x\)

8. Inez ran uphill for two-thirds of the marathon. Half of the rest was downhill and the other half was flat. Write at least one expression to represent the portion of the marathon Inez ran downhill.

\[\left(\frac{1}{2}\right)\left(\frac{1}{3}\right)x \quad \text{or} \quad \frac{1}{6}x\]

9. Cleon went to the bookstore where everything was 50% off. The store manager made an announcement that an additional 50% would be taken off the sale price at the cash register. Write an expression for the price of a book with both deductions taken.

\[b - 0.5b - 0.5(b - 0.5b) \text{ or } 0.50(0.50\times b) \text{ or } 0.25b.\]
Take time to examine the model for this problem. Show students both expressions are the same when simplified.

For #5 – 8, it is very important to have students justify their expressions.

10. Rico went to the store to buy a pair of pants because there was a 30% off all merchandise sale. When he got to the store he learned that purchases made before noon would receive an additional discount of 20% off the sale price. If the pants he picked out cost \(p\) dollars and he purchased them before noon, write an expression for the final cost of the pants.

\[(p - 0.30p) - (0.20(0.70p)) \quad \text{or} \quad 0.80(0.70)p\]

For #5 – 8, it is very important to have students justify their expressions.
3.1k Homework: Modeling Context with Algebraic Expressions

Write an algebraic expression for each context. In some cases you will be asked to write more than one expression. Be prepared to justify your expressions.

1. Marie would like to buy lunch for her three nieces. She would like each lunch to include a sandwich, a piece of fruit, and a cookie. A sandwich costs $3, a piece of fruit costs $0.50, and a cookie costs $1.
   a. Write two different expressions that could be used to represent the total price of all three lunches. Then simplify each expression that you wrote to find out how much total money Marie spent on lunch.
      \[3(3 + 0.50 + 1)\]  \[3\cdot3 + 3\cdot0.50 + 3\cdot1\]  \[9 + 1.50 + 3\]  \$13.50
   b. Write two different expressions that could be used to represent the total price of all three lunches if a sandwich costs \(x\) dollars, a piece of fruit costs \(y\) dollars, and a cookie costs \(z\) dollars.
      \[3(x + y + z)\]  \[3x + 3y + 3z\]

2. Boris is setting up an exercise schedule. For five days each week, he would like to play a sport for 30 minutes, stretch for 5 minutes, and lift weights for 10 minutes.
   a. Write two different expressions that could be used to represent the total number of minutes he will exercise in five days. Then simplify each expression that you wrote.

   b. Write two different expressions that could be used to represent the total number of minutes he will exercise in five days if he plays a sport for \(x\) minutes, stretches for \(y\) minutes, and lifts weights for half the time he plays a sport.

3. James had $550 in his checking count. Once a week, he spends \(d\) dollars on music downloads and $5 on food. Write two expressions for how much money James has in his account after five weeks.

4. Five girls on the tennis team want to wear matching uniforms. They know skirts will costs $24 but are not sure about the price of the top. Write two different expressions that could be used to represent the total cost of all five skirts and five tops if \(x\) represents the price of one top. Simplify each expression.
5. Drake, Mike, and Vinnie are making plans to go to a concert. They have a total of $200 between the three of them. The tickets cost $30 each, and each boy plans to buy a t-shirt for $t$ dollars. Write two different expressions to represent the amount of money the three boys will have left over. Simplify each expression.

\[ 200 – 3(30 + t) \]
\[ 200 – 30 – 30 – t – t – t \]
\[ 200 – 3(30) – 3t \]

Each expression should simplify to \(110 – 3t\)

6. Miguel has run three marathons. The first time he ran a marathon, it took him \(m\) minutes. The next time he ran he cut 10\% off his time. The third time he ran a marathon, he was able to cut an additional 5\% off his fastest time (the time he got on the second marathon). Write an expression for the amount of time it took Miguel to run the marathon the third time.

\[ 0.95(0.90x) \text{ or } (1x – 0.10x) – (0.05(1x – 0.10x)) \]

This context and the ones in #7 & 8 are different than #1 – 5.

7. Ana earned \(x\) dollars at her summer job. She put 50\% of her money into savings and spent 40\% of the rest on a new outfit. Write an expression for the amount of money she has left.

8. Marcela earns money working in her dad’s office over the summer. If she spent 40\% of her money on a new phone and 50\% of the rest on new clothes for school, write an expression for how much of her money she spent.
### 3.1 Self-Assessment: Section 3.1

Consider the following skills/concepts. Rate your comfort level with each skill/concept by checking the box that best describes your progress in mastering each skill/concept. Corresponding sample problems, referenced in brackets, can be found on the following page.

</tbody>
</table>
Sample Problems for Section 3.1

1. Given the following situation, match the parts of the expression to the parts of the context.

   Luis went to a soccer game with some friends. He bought two sodas for $1.50 each and four giant candy bars for $2.25 each. How much did he spend?

   \[2(1.50) + 4(2.25)\]

2. Explain the different parts of the following expression:

   Matthew likes to buy movies from a DVD club. He pays $5 per month plus $2 per movie. If he buys six movies in June, how much did he pay for the month of June?

   \[6(2) + 5\]

3. Write an expression to match the following situation. Explain the different parts of the expression.

   Nastas plays on the school basketball team. He scores five 3-pointers and 3 lay-ups (worth 2 points each) in one game. How many total points did he score in that game?

   \[3(8.50) + 5\]

4. Write an expression to match the following situation. Explain the different parts of the expression.

   Millie bought two sweaters for $25 and three pair of pants for $30. She had a 25% off coupon for her entire purchase. Write an expression for the amount of money Millie spent.

   \[3(8.50) + 3d\]

5. Identify which expressions match the following situation. Explain how each different correct expression reveals different aspects of the situation.

   Ooljee goes to the movies with her two friends. They each pay for their own movie ticket at $8.50 each and each buys a soda for \(d\) dollars. How much money do the girls spend at the theater?

   \[3(8.50) + 3d\]  \[3(8.50) + d\]  \[3(8.50 + d)\]  \[3(8.50)d\]  \[8.50 + d + 8.50 + d + 8.50 + d\]
6. Write at least two different expressions for the following situation. Explain how each different expression reveals different aspects of the situation.

Phoebe babysits every weekend. She puts 30% of each check into savings and spends 15% of the remainder on new books. How much does she have left?

7. Simplify the following expressions. Use a model if needed.
   a. \(9m - 3 + 4m\)
   b. \(-71b - 4a + 4b - 4a\)
   c. \(50q + 0.1t - 0.3t + 14q\)
   d. \(\frac{9}{10m} - \frac{3}{5} + \frac{4}{5}m + \frac{1}{2}m\)

8. Simplify the following expressions.
   a. \(8(-1 - 7w)\) \(-8(7w + (-6))\) \((10 + 7w)(-5)\)
   b. \(-6\left(\frac{1}{5}a - \frac{1}{6}\right)\) \(\frac{1}{4}(-6a + 8b)\) \(\frac{1}{3}\left(-7 - \frac{1}{6}a\right)\)

9. Factor the following expressions.
   \(3x - 6\) \(15 - 20y\) \(\frac{5}{3}x + \frac{2}{3}\) \(4.9t - 2.8\)

10. Identify the arithmetic property used in simplifying each expression.
    a. \(3x + 2 + x + -1\) \(3x + x + 2 + -1\) Property:
    b. \(4x + (-4x)\) \(0\) Property:
    c. \((3x + 2y) + y\) \(3x + (2y + y)\) Property:
Section 3.2 Solving Algebraic Equations \((ax + b = c)\)

Section Overview:
This section begins by reviewing and modeling one- and two-step equations with integers. Students then learn to apply these skills of modeling and solving to equations that involve the distributive property and combining like terms. Students learn to extend these skills to solve equations with rational numbers and look for errors in their own and other’s work.

Concepts and Skills to be Mastered (from standards)

*By the end of this section, students should be able to:*
1. Solve multi-step equations fluently including ones involving calculations with positive and negative rational numbers in a variety of forms.
2. Connect arithmetic solution processes that do not use variables to algebraic solution processes that use equations.
3. Use properties of arithmetic to create an argument or critique the reasoning of others in solving algebraic equations.
3.2 Class Discuss: Using Properties to Justify Steps for Simplify Expressions

At the beginning of 3.1, you named properties you’ve been using since elementary school. Without looking back or ahead, can you list the properties you’ve named to this point?

There is one last property to add to the list: Distributive Property of Multiplication over Addition.

The distributive property links addition and multiplication. Like the properties discussed at the beginning of 3.1, you’ve been using the distributive property informally since elementary school.

Examples:

Without a calculator, find the product $23 \times 7$. Explain your procedure.
Students are likely to say that $23 \times 7$ is 23 groups of seven. Since $23 = 20 + 3$, $20 \times 7 = 140$, and $3 \times 7 = 21$, then $23 \times 7 = 140 + 21 = 161$. This mental math strategy is the distributive property of multiplication over addition.

Without a calculator, find the product: $4 \times 3.1$. Explain your procedure.
12.4; procedures will vary. However, it is likely someone will explain that $3.1$ is $3 + 0.1$, $4 \times 3 + 4 \times 0.1$ is $12 + 0.4$, thus the answer is 12.4. This mental math strategy is the distributive property.

Show two ways one might simplify: $2(3 + 4)$
$2(3 + 4) = 2(7) = 14$
$2(3 + 4) = 2(3) + 2(4) = 6 + 8 = 14$

Use the distributive property to rewrite $a(b + c)$
$a(b + c) = a(b) + a(c)$
Review: Generalizing Properties

**Students did this in 3.1. This form is the same as that one except that it adds the distributive property.**

Properties of Mathematics:

<table>

</table>
| Multiplicative Inverse       | $a(1/a) = 1$ for $a 
eq 0$ | Multiplying a number by its multiplicative inverse will result in one, the multiplicative identity. |                                                                           |
Use properties to justify steps:

Example: Jane wants to find the sum: $3 + 12 + 17 + 28$. She uses the following logic, “3 plus 17 is 20, and 12 plus 28 is 40. The sum of 20 and 40 is 60.” Why is this okay? The table below shows how to justify her thinking using properties for each step.

<table>
<thead>
<tr>
<th>Statement</th>
<th>Step</th>
<th>Justification</th>
</tr>
</thead>
<tbody>
<tr>
<td>$3 + 12 + 17 + 28$</td>
<td>No change, this is where she started.</td>
<td>This expression was given.</td>
</tr>
<tr>
<td>$3 + 17 + 12 + 28$</td>
<td>The 17 and the 12 traded places.</td>
<td>Commutative Property of Addition</td>
</tr>
<tr>
<td>$(3 + 17) + (12 + 28)$</td>
<td>Jane chose to add the numbers in pairs first, which is like inserting parentheses.</td>
<td>Associative Property of Addition</td>
</tr>
<tr>
<td>$20 + 40$</td>
<td>Jane found the sums in the parentheses.</td>
<td>Jane is now following the Order of Operations.</td>
</tr>
<tr>
<td>$60$</td>
<td>Add, so . . . $3 + 12 + 17 + 28 = 60$</td>
<td></td>
</tr>
</tbody>
</table>

1) The expression $3(x - 4) + 12$ has been written in five different ways. State the property that allows each change.

<table>
<thead>
<tr>
<th>Expression</th>
<th>Step</th>
<th>Justification / Property Used</th>
</tr>
</thead>
<tbody>
<tr>
<td>$3(x + (-4)) + 12$</td>
<td>No change</td>
<td>This expression was given, but rewritten using the idea that $a - b = a + (-b)$</td>
</tr>
<tr>
<td>$3x + 3(-4) + 12$</td>
<td>Three groups of $(x + (-4))$ means $3x + (-12)$</td>
<td>Distributive Property</td>
</tr>
<tr>
<td>$3x + (-12) + 12$</td>
<td>$3x(-4) = -12$</td>
<td>Multiplication of integers</td>
</tr>
<tr>
<td>$3x + ((-12) + 12)$</td>
<td>Grouping for addition</td>
<td>Associative Property of Addition</td>
</tr>
<tr>
<td>$3x + 0$</td>
<td>12 and $-12$ combine to 0.</td>
<td>Additive Inverse Property</td>
</tr>
<tr>
<td>$3x$</td>
<td>$a + 0 = a.$</td>
<td>Additive Identity Property</td>
</tr>
</tbody>
</table>

2) The expression $2(3x + 1) + -6x + -2$ has been written in four different ways. State the property that allows each change.

<table>
<thead>
<tr>
<th>Expression</th>
<th>Step</th>
<th>Justification</th>
</tr>
</thead>
<tbody>
<tr>
<td>$2(3x + 1) + -6x + -2$</td>
<td>No change</td>
<td>Given expression</td>
</tr>
<tr>
<td>$6x + 2 + -6x + -2$</td>
<td>Multiplied 2 by both $3x$ and 1</td>
<td>Distributive Property</td>
</tr>
<tr>
<td>$6x + -6x + 2 + -2$</td>
<td>Changed the order of the terms</td>
<td>Commutative Property of Addition/Addition is Commutative</td>
</tr>
<tr>
<td>$(6x + -6x) + (2 + -2)$</td>
<td>$6x + (-6x)$ and $2 + (-2)$ both sum to 0</td>
<td>Associative Property of Addition</td>
</tr>
<tr>
<td>$0 + 0$</td>
<td>$6x + (-6x)$ and $2 + (-2)$ both sum to 0</td>
<td>Additive Inverse</td>
</tr>
</tbody>
</table>
Review: Look back at Chapter 2 and review addition/subtraction with the chip/tile model.

3) Model \(3 + (-5)\) to find the sum

| Step 1 | Step 2 | Justify each step:
|--------|--------|-----------------------------
| \[
\begin{array}{ccc}
1 & -1 & -1 \\
1 & -1 & -1 \\
1 & -1 & -1 \\
1 & -1 & -1 \\
\end{array}
\] | \[
\begin{array}{ccc}
1 & -1 & -1 \\
1 & -1 & -1 \\
1 & -1 & -1 \\
1 & -1 & -1 \\
\end{array}
\] | Step 1: this is a representation of the expression

Step 2: \(1 + (-1) = 0\), so each of these pairs are zero: 
\(-1\) is the additive inverse of \(1\).

Step 3: this is a representation of what remains when the zero pairs are removed.

4) In chapter 2 you learned that a negative times a negative produces a positive product. We used models to discover why this is true. Below is a more formal proof. We start with the the Multiplicative Property of Zero (anything times zero is 0.)

<table>
<thead>
<tr>
<th>Statement</th>
<th>Step</th>
<th>Justification</th>
</tr>
</thead>
<tbody>
<tr>
<td>(-1(0) = 0)</td>
<td>Given</td>
<td>Multiplicative Property of Zero</td>
</tr>
<tr>
<td>(-1(-1 + 1) = 0)</td>
<td>0 was replaced with ((-1 + 1))</td>
<td>Additive Inverse Property</td>
</tr>
<tr>
<td>(-1(-1) + -1(1) = 0)</td>
<td>(-1) was multiplied by each term in parentheses</td>
<td>Distributive Property</td>
</tr>
<tr>
<td>(-1(-1) + 1(-1) = 0)</td>
<td>The (-1(1)) got switched to (1(-1))—changed the order of multiplication</td>
<td>Commutative Property of multiplication</td>
</tr>
<tr>
<td>(-1(-1) + -1 = 0)</td>
<td>(1(-1)) was replaced with (-1)</td>
<td>Identity Property of Multiplication</td>
</tr>
<tr>
<td>(-1(-1)) must equal 1 because if we get 0 when we add it to (-1), it must be the additive inverse of (-1)</td>
<td>Additive Inverse Property</td>
<td></td>
</tr>
</tbody>
</table>
3.2a Classroom Activity: Model and Solve Equations

Use any method you’d like to solve each of the following. Justify your answer with a model or words:

<p>| | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>$m + 3 = 7$</td>
<td></td>
</tr>
<tr>
<td></td>
<td>$m$</td>
<td>$3$</td>
</tr>
<tr>
<td>2.</td>
<td>$8 = k - 2$</td>
<td></td>
</tr>
<tr>
<td></td>
<td>$k$</td>
<td></td>
</tr>
<tr>
<td>3.</td>
<td>$3n = 18$</td>
<td></td>
</tr>
<tr>
<td></td>
<td>$n$</td>
<td>$n$</td>
</tr>
</tbody>
</table>

To find $k$, we will need to “remove” $-2$ from both sides. We can also think about $k - 2$ as $k + (-2)$.

<p>| | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>4.</td>
<td>$17 = 2j + 1$</td>
<td></td>
</tr>
<tr>
<td></td>
<td>$j$</td>
<td>$j$</td>
</tr>
<tr>
<td>5.</td>
<td>$j/2 = 6$</td>
<td></td>
</tr>
<tr>
<td></td>
<td>$j/2$</td>
<td>$6$</td>
</tr>
<tr>
<td>6.</td>
<td>$y + 3 = -5$</td>
<td></td>
</tr>
<tr>
<td></td>
<td>$y$</td>
<td>$3$</td>
</tr>
</tbody>
</table>

To find $y$, we must “take away 3 from both the $y + 3$ and the $-5$”

It may have been easy to solve some (or all) of the above in your head, that’s good; that means you’re making sense of the problem. In this section, we are going to focus on the structure of equations and how properties of arithmetic allow us to manipulate equations. Even though the “answer” is important, more important right now is that you understand the underpinnings of algebraic manipulations.

**Evaluate** the expression $2x + 1$ for each of the given values:

<p>| | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>7.</td>
<td>Evaluate $2x + 1$ for $x = 3$</td>
<td></td>
</tr>
<tr>
<td></td>
<td>$2x + 1$</td>
<td>$3$</td>
</tr>
<tr>
<td>8.</td>
<td>Evaluate $2x + 1$ for $x = -2$</td>
<td></td>
</tr>
<tr>
<td></td>
<td>$2x + 1$</td>
<td>$-2$</td>
</tr>
<tr>
<td>9.</td>
<td>Evaluate $2x + 1$ for $x = -3$</td>
<td></td>
</tr>
<tr>
<td></td>
<td>$2x + 1$</td>
<td>$-3$</td>
</tr>
</tbody>
</table>

Discuss how the unknown in an expression can represent any number. Also, discuss “evaluate” vs. “solve.”

**Solve** each equation in any way you want. Be able to justify your answer with a model or words:

<p>| | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>8.</td>
<td>$2x + 1 = 5$</td>
<td></td>
</tr>
<tr>
<td></td>
<td>$2x + 1$</td>
<td>$5$</td>
</tr>
<tr>
<td>9.</td>
<td>$2x + 1 = 9$</td>
<td></td>
</tr>
<tr>
<td></td>
<td>$2x + 1$</td>
<td>$9$</td>
</tr>
<tr>
<td>10.</td>
<td>$2x + 1 = -9$</td>
<td></td>
</tr>
<tr>
<td></td>
<td>$2x + 1$</td>
<td>$-9$</td>
</tr>
</tbody>
</table>

Discuss that the expression $2x + 1$ was set equal to three different numbers, resulting in different values of the unknown $x$.

What do the terms “evaluate” and “solve” mean?

What is the difference between an equation and an expression?

For this activity use the following Key to represent variables and integers. Note: “x” or “-x” can be any variable.

![Key for variables and integers]

11. Consider the equation: \( x - 1 = 6 \). What value of \( x \) makes this equation true? Justify:

Look for language that illustrates algebraic thinking. For example a student might say, “I know \( x \) has to be one-unit bigger than 6 because if you subtract 1 you get 6.”

Draw a model of \( x - 1 = 6 \) below, then use it to illustrate the algebraic steps need to isolate the “x.”

To isolate the “x,” we want to add 1 to both sides of the equation.

Throughout these exercises, students should discuss properties of arithmetic.

It will be very helpful to change the problem to \( x + (-1) = 6 \) and continue this structure throughout. In this way we are always adding the additive identity. As problems become more complex, students often become confused with problems like \( 5x - 7 = -3 \); students will not know if they should add 7 or -7 or if they should subtract 7 or -7.

\[
\begin{align*}
x - 1 &= 6 \\
+1 &+1 \\
x &= 7
\end{align*}
\]

additive inverse
12. Consider the equation: \( x - 3 = 5 \). What value of \( x \) makes this equation true? Justify:

Draw a model of \( x - 3 = 5 \) below, then use it to illustrate the algebraic steps needed to solve.

<table>
<thead>
<tr>
<th>( x )</th>
<th>-1</th>
<th>-1</th>
<th>-1</th>
</tr>
</thead>
<tbody>
<tr>
<td>This is the same as ( x + (-3) = 5 )</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Talk about “equality;” adding “3” to both sides of the equation maintains equality. 3 and \((-3)\) are additive inverses.

\[
\begin{align*}
&= x - 3 = 5 \\
&+ 3 + 3 \\
&x = 8 \\
&\text{additive inverse}
\end{align*}
\]

13. Use a model to solve \( 8 = 7 + m \). Write the algebraic procedure you followed to solve.

Students should be comfortable with the unknown on either side of the equal sign.

<table>
<thead>
<tr>
<th>( 8 = 7 + m )</th>
</tr>
</thead>
<tbody>
<tr>
<td>( 8 = 7 + m ) +(-7) +(-7)</td>
</tr>
<tr>
<td>( 8 = 7 + m ) additive inverse</td>
</tr>
<tr>
<td>( 1 = m )</td>
</tr>
</tbody>
</table>

14. Consider the equation: \( 6 = 3x \). What value of \( x \) makes this equation true? Justify:

Draw a model of \( 6 = 3x \) below, then use it to illustrate the algebraic steps needed to solve.

<table>
<thead>
<tr>
<th>( x )</th>
<th>-1</th>
<th>-1</th>
<th>-1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Help students notice that each ( x ) corresponds to two units. To isolate the ( x ) in this situation we apply the multiplicative inverse.</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Students might say, “three times what is 6; well I know that 3 times 2 is 6.” Push for how they know that.

\[
\begin{align*}
&= (1/3) \cdot 6 = (1/3) \cdot 3x \\
&6/3 = 3/3 \times x \\
&\text{multiplicative inverse so } x = 2
\end{align*}
\]
15. \(8 = -2m\). Write the algebraic procedure you followed to solve.

Students might take the “opposite” of both sides: 
\(-8 = 2m\), or they may work with the problem the way it is. Allow students time to Make Sense of the Problem.

Here the negative sign might throw students. You might ask, “\(-2\) times what is positive 8?” Students will likely know the answer has something to do with 4. Have students test their conjectures.

\[8 = -2m\]

LOOK FOR STRUCTURE.
Students are trying to isolate the unknown. To isolate they need to use the “opposite” operation. In other words, they need to apply inverses, either additive or multiplicative.

\[m = -4\]

16. Consider the equation \(-5 + 3n = 7\). What value of \(n\) makes the equation true? Justify:

Draw a model of the equation and use it to solve the equation. Write the algebraic procedure you followed to solve.

This is the first two step equation students solve. The model allows students to “see” that the “\(-5\)” and “\(3n\)” are different from each other. Thus, when they add 5 to both sides of the equal sign, they will physically see the “zero pairs” (additive inverses). This becomes less clear if students work problems without a model.

Talk to students about the fact that there are two operations on the left, addition and multiplication. We need to “undo” both. Thus we need to apply the additive inverse to \(-5\) and the multiplicative inverse to \(3\).

\[\text{add 5 to both sides; additive inverse.} \quad 3n = 12\]

In applying the additive inverse, help students recognize that: \((-5 + 3n) + 5\) is \(3n\) BUT \((-5 + 3n)(1/3)\) is \(-5/3 + n\): link to the distributive property. We generally choose to apply the additive inverse first when solving not because there is any such rule, but rather for ease.

Multiply both sides by \(1/3\);
multiplicative inverse; \(n = 4\)
17. Consider the equation \(-4 = -3m + 8\). What value of \(m\) makes the equation true? Justify.

Draw a model of the equation and use it to solve the equation. Write the algebraic procedure you followed to solve.

<table>
<thead>
<tr>
<th>Equation</th>
<th>Side 1</th>
<th>Side 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>(-4 = -3m + 8)</td>
<td>(-4 = -3m + 8)</td>
<td></td>
</tr>
</tbody>
</table>

- Add \(-8\) to both sides; additive inverse.
- \(-3m = -12\)

<table>
<thead>
<tr>
<th>Equation</th>
<th>Side 1</th>
<th>Side 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>(-4 = -3m + 8)</td>
<td>(-4 = -3m + 8)</td>
<td></td>
</tr>
</tbody>
</table>

- Multiply both sides by \(-\frac{1}{3}\); multiplicative inverse.
- \(n = 4\)

Additional Practice Students may want to draw a model on a separate piece of paper.

18) \(-7 = m - 9\) \(m = 2\)

19) \(12 = w + (-4)\) \(w = 16\)

20) \(-4k = -20\) \(k = 5\)

21) \(-18 = 2n\) \(n = -9\)

22) \(3x = -15\) \(x = -5\)

23) \(40 = -5y\) \(y = -8\)

24) \(5 = -2x + 9\) \(x = 2\)

25) \(4x + 7 = -5\) \(x = -3\)

26) \(-8 = -3m + 10\) \(m = 6\)

27) \(7z + 1 = 15\) \(z = 2\)
### 3.2a Homework: Model and Solve Equations

Model and solve each equation below. Use the key below to model your equations.

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>-x</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

1. \( x - 6 = -9 \)

\[

\hline
x \\
\hline
\end{array} \\
\begin{array}{c}
-1 \\
-1 \\
-1 \\
\end{array} \\
\begin{array}{c}
= \\
= \\
= \\
\end{array} \\
\begin{array}{c}
\hline
\end{array} \\
\begin{array}{c}
\hline
\end{array} \\
\begin{array}{c}
\text{Additive Inverse} \\
\hline
x = -3 \\
\end{array} \\
\begin{array}{c}
\hline
\end{array} \\
\begin{array}{c}
\hline
\end{array}
\]

2. \( -15 = x - 14 \)

\[
\begin{array}{c}
\hline
\end{array} \\
\begin{array}{c}
\hline
\end{array} \\
\begin{array}{c}
\hline
\end{array} \\
\begin{array}{c}
\hline
\end{array}
\]

\[
\begin{array}{c}
\text{Additive Inverse} \\
\hline
x = -1 \\
\end{array} \\
\begin{array}{c}
-1 \\
-1 \\
\end{array} \\
\begin{array}{c}
= \\
= \\
\end{array} \\
\begin{array}{c}
\hline
\end{array} \\
\begin{array}{c}
\hline
\end{array} \\
\begin{array}{c}
\text{Additive Inverse} \\
\hline
-15 = x - 14 \\
\end{array} \\
\begin{array}{c}
\hline
\end{array} \\
\begin{array}{c}
\hline
\end{array} \\
\begin{array}{c}
\hline
\end{array}
\]
3. \( m + 2 = -11 \)

Add negative 2 to both sides

Additive Inverse

\[ m = -9 \]

4. \( 4n = -12 \)

5. \( -15 = -3m \)

students may take the opposite of both sides to model: \( 15 = 3m \)
6. $3t + 5 = 2$

$$
\begin{array}{c}
3t + 5 = 2 \\
3t + 5 - 5 = 2 - 5 \\
3t = -3 \\
3t/3 = -3/3 \\
t = -1
\end{array}
$$

7. $8 = 2p - 4$

$$
\begin{array}{c}
8 = 2p - 4 \\
8 + 4 = 2p - 4 + 4 \\
12 = 2p \\
12/2 = 2p/2 \\
p = 6
\end{array}
$$
3.2b Class Activity: More Model and Solve One- and Two-Step Equations

Draw a model, justify your steps and then check your answer. The first one is done for you.

<table>
<thead>
<tr>
<th>Model/Draw the Equation</th>
<th>What are the solving actions? Record the steps using Algebra</th>
<th>Check solution in the equation.</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. (x + 5 = 8)</td>
<td>Add (-5) to both sides. (-5) is the additive inverse of (5). This step isolates the (x). (x + 5 = 8) Add (-5) (x) (\frac{5}{-5}) (x = 3) (3 + 5 = 8) True, so the solution is correct.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>(x = -3)</td>
<td>Show check</td>
</tr>
<tr>
<td>2. (5 = x + 8)</td>
<td></td>
<td>Show work</td>
</tr>
</tbody>
</table>

Look at # 1 and # 2. Why are the answers different?
3. $3x = -6$

Explain the logic above in #3. The multiplicative inverse of 3 is $\frac{1}{3}$, we multiply both sides by $\frac{1}{3}$ to isolate the $x$. You might also talk about the model—three $x$ rectangles are the same as six negative one units. Thus each $x$ corresponds to two negative one units—we had to divide the units into 3 equal parts to see what each $x$ represented. Remind student that multiplying both sides by $\frac{1}{3}$ is the same as dividing both sides by three. How might you use related logic to model $x/3 = -6$? Ask students how they might rewrite the equation: $(1/3)x = -6$. Talk about $3$ as the multiplicative inverse of $(1/3)$. Also talk about why $x/3$ means, e.g. if we have $1/3$ of an $x$, we need to triple it to know how much one whole $x$ represents. If we triple $x/3$ we need to triple $-6$ as well.

4. $x/3 = -6$

1/3 of an $x$ is $-6$, so if we triple both sides, a whole $x$ is $-18$.

5. $(1/2)x = 3$

$\frac{1}{2}$ of an $x$ is 3, so a whole $x$ is 6.

In problems #3 and #4, what happened to the terms on both sides of the equation? Both sides of the equation were multiplied by the multiplicative inverse of the coefficient of $x$. 

Show work
$x = -2$

Show check

Show work
$x = -18$

Show check

Show work
$x = 6$

Show check
<table>
<thead>

<td>(x = 1)</td>
</tr>
</tbody>
</table>
8. \(-4(3 - 2m) = -12\)

**Again, they may be unsure what to do when nothing is left on side of the equation. i.e. they will get \(8m = 0\). Look back at Review #3.

\[ m = 0 \]

9. \(-\frac{1}{2}(4x + 2) = -5\)

**Look for different strategies (like on #5): (a) doubling both sides OR (b) distributing the \(-\frac{1}{2}\). Talk about both.

a). \((-2)\left(-\frac{1}{2}\right)(4x + 2) = (-2)(-5)\)

(b) \(\left(\frac{1}{2}\right)(4x + 2) = 5\)

\[ 2x + 1 = 5 \]

\[ x = 2 \]

10. \(3(2x - 4) + 6 = 12\)

\[ x = 3 \]
Solve each equation. Justify your algebraic manipulations on the right.

1. \(9 = 15 + 2p\)

2. \(-7 = 2h - 3\)

3. \(-5x - 12 = 13\)
4. \( 6 = 1 - 2n + 5 \)

See model

\[
\begin{align*}
6 &= 1 - 2n + 5 \\
6 &= 6 - 2n \\
-6 &= +6 - 2n \\
0 &= -2n \\
0 &= -2n \\
-2 &= -2 \\
0 &= n \\
n &= 0
\end{align*}
\]

5. \( 8x - 2 - 7x = -9 \)

\[
\begin{align*}
8x - 2 - 7x &= -9 \\
\end{align*}
\]

6. \( 2(n - 5) = -4 \)

\[
\begin{align*}
2(n - 5) &= -4 \\
\end{align*}
\]
7. $-3(g - 3) = 6$

8. $-12 = 3(4c + 5)$

See model

$$
\begin{align*}
-12 &= 3(4c + 5) \\
\frac{-12}{3} &= \frac{3(4c + 5)}{3} \\
-4 &= 4c + 5 \\
-5 &= 4c - 5 \\
-9 &= 4c \\
\frac{-9}{4} &= c \\
c &= \frac{-9}{4}
\end{align*}
$$
### 3.2d Class Activity: Error Analysis

Students in Mrs. Jones’ class were making frequent errors in solving equations. Help analyze their errors. Examine the problems below. When you find the mistake, circle it, explain the mistake and solve the equation correctly. Be prepared to present your thinking.

<table>
<thead>
<tr>
<th>Student Work</th>
<th>Explanation of Mistake</th>
<th>Correct Solution Process</th>
</tr>
</thead>
</table>
| 1. \(-6t = 30\) \[
  \begin{array}{c}
  -6 \\
  t = 5
  \end{array}
\] | The student forgot the negative. Multiplicative inverse is \((-1/6)\) \[
  \begin{array}{c}
  -6t = 30 \\
  t = \frac{30}{-6}
  \end{array}
\] | \[
  t = 5
\] |
| 2. \(\frac{3}{4}x = 12\) \[
  \begin{array}{c}
  \frac{3}{4}x = 12 \\
  x = 9
  \end{array}
\] | The Multiplicative inverse of \(3/4\) is \(4/3\) \[
  \begin{array}{c}
  \frac{4}{3} \cdot \frac{3}{4}x = \frac{4}{3} \cdot 12
  \end{array}
\] | \[
  \begin{array}{c}
  \frac{4}{3} \cdot \frac{3}{4}x = \frac{4}{3} \cdot 12 \\
  x = 9
  \end{array}
\] |
| 3. \(8 - 5c = -37\) \[
  \begin{array}{c}
  8 \\
  -5c = -37 \\
  c = -9
  \end{array}
\] | On the second line the student forgot to keep the negative. \(a - b = a + (-b)\) \[
  \begin{array}{c}
  8 - 5c = -37 \\
  -8 \\
  -5c = -45 \\
  c = 9
  \end{array}
\] | \[
  \begin{array}{c}
  8 - 5c = -37 \\
  -8 \\
  -5c = -45 \\
  -5 \\
  c = 9
  \end{array}
\] |
| 4. \(\frac{x + 1}{3} = 2\) \[
  \begin{array}{c}
  \frac{x + 1}{3} = 2 \\
  x + 1 = 6 \\
  x = 5
  \end{array}
\] | \[
  \begin{array}{c}
  3 \cdot \left(\frac{x + 1}{3}\right) = 3 \cdot 2 \\
  x + 1 = 6 \\
  x = 5
  \end{array}
\] | \[
  \begin{array}{c}
  3 \cdot \left(\frac{x + 1}{3}\right) = 3 \cdot 2 \\
  x + 1 = 6 \\
  -1 \\
  x = 5
  \end{array}
\] |
<table>
<thead>
<tr>
<th></th>
<th>Equation</th>
<th>Student Error</th>
<th>Correct Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.</td>
<td>$4x - 3 = 17$</td>
<td>The student subtracted when division was necessary. Student applied additive inverse rather than multiplicative inverse.</td>
<td>$4x - 3 = 17$ $\Rightarrow \frac{4x - 3}{4} = \frac{17}{4} \Rightarrow x = 5$</td>
</tr>
<tr>
<td>6.</td>
<td>$3(2x - 4) = 8$</td>
<td>The student did not distribute accurately. There are 3 groups, of $(2x - 4)$. So there will be $6x$ and $-8$.</td>
<td>$3(2x - 4) = 8$ $\Rightarrow 6x - 12 = 8$ $\Rightarrow \frac{6x}{6} = \frac{10}{3}$ $\Rightarrow x = \frac{5}{3}$</td>
</tr>
<tr>
<td>7.</td>
<td>$3x + 2x - 6 = 24$</td>
<td>The student subtracted $2x$ twice from the same side of the equation. The equality was not maintained.</td>
<td>$3x + 2x - 6 = 24$ $\Rightarrow 5x - 6 = 24$ $\Rightarrow \frac{5x}{5} = \frac{30}{5}$ $\Rightarrow x = 6$</td>
</tr>
<tr>
<td>8.</td>
<td>$5x + 1 - (-2x) = -8$</td>
<td>The student failed to note $a - (-b) = a + b$. Taking away $-2x$ is the same as adding $2x$.</td>
<td>$5x + 1 - (-2x) = -8$ $\Rightarrow 5x + 1 + 2x = -8$ $\Rightarrow 7x + 1 = -8$ $\Rightarrow \frac{7x}{7} = \frac{-9}{7}$ $\Rightarrow x = \frac{-9}{7}$</td>
</tr>
<tr>
<td>9.</td>
<td>$-2(x - 2) = 14$</td>
<td>The student did not distribute correctly. Likely not accounting for the negatives.</td>
<td>$-2(x - 2) = 14$ $\Rightarrow -2x + 4 = 14$ $\Rightarrow \frac{-2x}{-2} = \frac{10}{-2}$ $\Rightarrow x = -5$</td>
</tr>
</tbody>
</table>
10. \(3(2x + 1) + 4 = 10\)

\[
\begin{align*}
6x + 3 + 4 & = 10 \\
9x + 7 & = 10 \\
-7 & = -7 \\
\hline
9x & = 6 \\
9 & = 9 \\
\frac{9}{9} & = \frac{6}{9} = \frac{2}{3} \\
\hline
x & = \frac{2}{3}
\end{align*}
\]

The student added terms that were not like terms.

\[
\begin{align*}
3(2x + 1) + 4 & = 10 \\
6x + 3 + 4 & = 10 \\
6x + 7 & = 10 \\
-7 & = -7 \\
\frac{6x}{6} & = \frac{-3}{6} \\
x & = \frac{1}{2}
\end{align*}
\]
3.2d Homework: Practice Solving Equations (select homework problems)

Solve each equation.

1. $8 - t = -25$
2. $2n - 5 = 21$
3. $3 - y = 13$
   $-10 = y$

4. $12 = 5k - 8$
5. $-5 - b = 8$
6. $5 = -6a + 5$
   $4 = k$

7. $8 = \frac{n}{-7}$
8. $8 = \frac{x}{7} + 5$
9. $\frac{y}{3} + 2 = 10$
   $21 = x$

10. $\frac{t}{3} + 4 = 2$
11. $9 = \frac{n}{-8} - 6$
12. $\frac{y}{5} + 4 = -12$
   $-80 = y$

13. $8 + 6 = -p + 8$
14. $-7 + 8x - 4x = 9$
15. $8x - 6 - 8 - 2x = 4$
   $4 = x$

16. $6(m - 2) = 12$
17. $5(2c + 7) = 80$
18. $5(2d + 4) = 35$
   $1.5 = d$

19. $3(x + 1) = 21$
20. $7(2c - 5) = 7$
21. $6(3d + 5) = 75$
   $6 = x$

22. $4 - 14 = 8m + 2m$
23. $-1 = 5p + 3p - 8 - p$
24. $5p - 8p = 4 + 14$
   $1 = p$

25. $2p - 4 + 3p = -9$
26. $-8 = -x + 5 - 1$
27. $12 = 20x - 3 + 4x$
   $x = 15/24 = 5/8$

3.2 $-1 = p$
Solve One- and Two-Step Equations with Rational Numbers (use algebra to find solutions)

Before we begin… Additional practice is available at 3.2g

…how can we find the solution for this problem?  
\[ \frac{3}{5}x = 6 \]

…do you expect the value for \( x \) to be larger or smaller than 4 for these problems? Explain.

\[ \frac{2}{3}x = 4 \]  
\[ 0.25x = 8 \]

…how can you figure out the solutions in your head?

Review equivalent forms of rational numbers from Chp 1

Solve the equations for the variable. Show all solving steps. Check the solution in the equation (example #1 check: \(-13(3) = -39, \text{true}\)). Be prepared to explain your work.

1. \(-13m = -39\)  
   \(m = 3\)
   Students should divide both sides by \(-13\) to get \(m = 3\). They should check their answer by substituting 3 for \(m\) in the original equation, so they will show \(-13(3) = -39\), which is true.

2. \(-2 = \frac{m}{16}\)  
   \(m = -32\)

3. \(y - 25 = 34\)  
   \(y = 59\)

4. \(-2y = 24\)  
   \(y = -12\)

   Compare #4 and #7. In #4) two “y”s are \(-24\), in #7 half an \(x\) is 6. In both we want to know what one unknown is worth.

Check:

5. \(-3x = \frac{3}{4}\)  
   \(x = -\frac{1}{4}\)

6. \(-13 = -25 + y\)  
   \(12 = y\)

7. \(\frac{1}{2}x = 6\)  
   \(x = 12\)

8. \(\frac{3}{4}x = 6\)  
   \(x = 8\)

Check:

[3]
## Sample Problems for Section 3.2

1. Solve each of the following equations with or without a model.
   a. 
   \[
   \begin{align*}
   -1 &= x + 7 \\
   -2x + 3 &= 7 \\
   30 &= \frac{x}{7} - 20
   \end{align*}
   \]
   b. 
   \[
   \begin{align*}
   -3(x - 6) &= 9 \\
   -3 &= \frac{2x + 4}{2} \\
   -3x + 5x + 4 &= 4
   \end{align*}
   \]
   c. 
   \[
   \begin{align*}
   0.8 + (-8) &= 0 \\
   \frac{1}{2}(-2x - 7) &= \frac{3}{4} \\
   -\frac{1}{4} &= 2.4x + 10 - 0.35x
   \end{align*}
   \]

2. Solve the following equations. Explain why you used fractions or decimals to get your final answer.
   \[
   \begin{align*}
   -\frac{1}{7} &= x - 4.7 \\
   -\frac{1}{2} &= 2x + 0.8
   \end{align*}
   \]
3. Francisca is asked to solve the following equation. Francisca’s work is shown below.

\[
\begin{align*}
3.5 &= \frac{1}{3}(x - 1.5) \\
3.5 &= \frac{1}{3}x - 1.5 \\
+1.5 &= +1.5 \\
5 &= \frac{1}{3}x \\
\cdot 3 &= \cdot 3 \\
15 &= x
\end{align*}
\]

What mistake did Francisca make?

Help Francisca answer the question correctly.
Section 3.3: Solve Multi-Step Real-World Problems Involving Equations and Percentages

Section Overview:
In this section students learn how to solve percent problems using equations. They begin by drawing bar models to represent relationships in word problems. Then they translate their models into equations which they then solve. Students then use similar reasoning to move to problems of percent of increase and percent of decrease. Finally, students put all of their knowledge together to solve percent multi-step problems with various types of rational numbers.

Concepts and Skills to be Mastered (from standards)

By the end of this section, students should be able to:
1. Use variables to create equations that model word problems.
2. Solve word problems leading to linear equations.
3. Solve multi-step real-life percent problems involving calculations with positive and negative rational numbers in a variety of forms.
4. Convert between forms of a rational number to simplify calculations or communicate solutions meaningfully.
3.3a Class Activity: Create Equations for Word Problems and Solve

For each each context, draw a model to represent the situation, write an equation that represents your model, solve the equation, and then answer the question in a full sentence. Check your answers in original problem.

1. Today is Rosa’s 12\textsuperscript{th} birthday. She has a savings account with $515 in it, but her goal is to save $10,000 by the time she turns 18. How much money should she add to her savings account each month to reach her goal of $10,000 between now and her 18\textsuperscript{th} birthday?

\[ 515 + 72x = 10,000 \]
\[ 72x = 9485 \]
\[ x = 9485/72 \approx $131.74 \text{ per month} \]

6 years is 72 months (6\times12)

2. Eisenhower Junior High School made 1250 hotdogs to sell at the county fair as a fundraiser for new computers. They’re only going to sell them for two days. On the first day, they sold 436 hot dogs. If they plan on selling for 8 hours on the second day, how many hot dogs per hour will they have to sell in order to sell the rest of their hotdogs?

\[ 8x + 436 = 1250 \]
\[ x = 101.75 \]

Make sense of the problem. You can’t sell 0.75 of a hotdog. Talk about rounding and how to answer the question in a complete sentence.

3. Calisa’s grandpa won’t tell her how old he is. Instead he told her, “I’m twice your mom’s age.” Calisa knows her mom had her when she was 24 and Calisa is now 12. How old is Calisa’s grandpa?

\[ \text{Mom was 24 when she had Calisa} \]
\[ \text{Grandpa is twice (12 + 24)} \]
\[ G = 2(12 + 24) \]
\[ G = 72 \]

Grandpa is 72 years old.

Grandpa is twice mom’s age
4. Calisa’s grandpa was really impressed that she was able to figure out his age, so he decided to give her another riddle. He said, “The sum of your great grandparents’ age is 183. If great grandpa is 5 years older than great grandma, how old is each of them?”

\[ g = \text{great grandma’s age} \]
\[ g + (g + 5) = 183 \]
\[ g = 89 \]
So Great Grandma is 89 and Great Grandpa is 94

5. Peter tends a total of 87 sheep and goats. He had 15 more sheep than goats. How many sheep and goats does he have?

\[ 87 = g + (g + 15) \]
\[ g = 36 \]
Peter has 36 goats and 51 sheep

6. Peter’s neighbor raises chickens; both hens and roosters. Their family sells the eggs, so they like to have four times as many hens as roosters. If they currently have 45 birds, how many are hens?

\[ 45 = r + 4r \]
\[ r = 9 \]
There are 9 roosters and 36 hens

7. James is five inches taller than twice his height when he was three years old. If he’s now 5’ 10” tall, how tall was he when he was three?

\[ 2j + 5 = 67 \]
\[ j = 33 \]
When James was 3 years old, he was 33” tall.
3.3a Homework: Create Equations for Word Problems and Solve

Example 1:

Peter tends a total of 87 sheep and goats. He had 15 more sheep than goats. How many sheep and goats does he have?

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>( g ) is number of goats &amp; ( g + 15 ) is the number of sheep</td>
<td></td>
</tr>
<tr>
<td>( g + 15 ) &amp; ( g )</td>
<td></td>
</tr>
</tbody>
</table>

\(< ----------------------------------------87 ----------------------------------------------------->

We know that there are more sheep than goat. We know that there are exactly 15 more sheep than goat, so the smaller rectangle represents \( g \) goat, and the larger is \( g + 15 \) sheep. There are total of 87 sheep and goat, so we can write the equation:

\[ g + (g + 15) = 87 \]

\[ g = 36; \text{ thus we know that there are } 36 \text{ goat and } 51 \text{ sheep.} \]

Example 2:

Peter’s neighbor raises chickens; both hens and roosters. Their family sells the eggs, so they like to have four times as many hens as roosters. If they currently have 45 birds, how many are hens?

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>( r ) roosters; ( r ) = # roosters &amp; ( r, r, r, r ) Hens; four times as many hens as roosters</td>
<td></td>
</tr>
<tr>
<td>( r, r, r, r )</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

There are a total of 45 chickens

We know that there are more hens than roosters. Further, we know that there are four times as many hens as roosters. So if \( r \) is the number of roosters, then \( 4r \) is the number of hen. All together there are 45 chickens, so we can write:

\[ r + 4r = 45 \]

\[ r = 9 \]

So there are 9 roosters and 36 hens.
For each context, draw a model, write an equation, and then write a complete sentence to answer the question in the context.

<table>
<thead>
<tr>
<th>Context</th>
<th>Equation</th>
<th>Answer</th>
</tr>
</thead>
</table>
| The blue jar has 27 more coins than the red jar. If there are a total of 193 coins, how many coins are in each jar? | \[ r = \text{number of coins in red jar} \]
\[ r + 27 = \text{number of coins in blue jar} \]
\[ 193 = r + (r + 27) \]
r = 83
There are 83 coins in the red jar and 110 coins in the blue jar. | | |
| Leah’s age is twice her cousin’s age. If they add their ages together, they get 36. How old are Leah and her cousin? | | |
| There are a total of 127 cars and trucks on a lot. If there are four more than twice the number of trucks than cars, how many cars and trucks are on the lot? | \[ c = \text{cars} \]
\[ 2c + 4 = \text{trucks} \]
\[ c + (2c + 4) = 127 \]
c = 41; there are 41 cars and 86 trucks. | | |
| Art’s long jump was 3 inches longer than Bill’s. Together they jumped 20 feet. How far did they each jump? | | |
| Juliana and Maria logged a total of 90 hours working for their dad. Juliana worked 2 hours more than three times as much as Maria. How many hours did Juliana work? | | |
| There are 17 more boys than girls at Juab Junior High School. If there are a total of 981 students there, how many students are boys? | | |
| A total of 81 points were scored at the basketball game between White Horse High School and Bear River High School. If White Horse scored 7 points more than Bear River, how many points did White Horse score? | \[ b = \text{the number of points Bear River scored} \]
\[ b + 7 = \text{the number of points White Horse scored} \]
\[ b + (b + 7) = 81 \]
b = 37
White Horse scored 44 points. | | |
| Pedro spent 57 minutes doing his math and language arts homework. His language arts homework took him twice as long as his math homework. How much time did he spend on his language arts homework? | | |
3.3b Class Activity: Writing Equations to Solve Percent Problems

Do the indicated for each context.

1. Last week, Dirk jumped \( y \) inches in the long jump. This week, he increased the length of his jump by 10%. If this week he jumped 143 inches, how far did he jump last week?

   a) Draw a model:

   ![Diagram showing last week's jump and this week's jump with 10% increase]

   b) Write an equation to answer the question: \( 143 = y + 0.10y \) or \( 143 = 1.1y \)

   c) Solve for the unknown: \( y = 130 \)

   d) Write a sentence stating the answer to the question: Dirk jumped 130 inches last week.

2. Consider these two contexts, write an equation for each and then solve:

   Luis wants to buy a new smart phone. Because he’s had another phone with the carrier, he will get an 18.25% discount. If the phone he wants is normally $325.50, how much will he pay?

   Mica bought a new smart phone for $258.13. That was the price after his 18.25% discount. What was the original price of the phone?

How are the equations similar? How are they different?

3. Consider the three equations below. Write a context for each and then state the answer to your context question.

   a. \( x - 0.28x = 252 \) \( x = 350 \)

      The goal here is understanding structure of percent equations. e.g. understanding 28% off an amount is the same as 72% of the amount. Further it is not the same as 28% of the amount.

   b. \( 0.72x = 252 \) \( x = 350 \)

   c. \( 0.28x = 252 \) \( x = 900 \)
4. Drake wants to buy a new skateboard with original price of $s$ dollars. The skateboard is on sale for 20% off the regular price; the sale price is $109.60.

   a. Draw a model, write an equation, and solve it to find the original price of the skateboard.

   \[
   s - 0.2s = 109.60 \quad \text{or} \quad 0.8s = 109.60
   \]

   \[
   s = 137, \text{ the original price of the skateboard was } \$137.
   \]

   b. Drake decided to buy the skateboard for the sale price. When he got to the counter, he got an additional 10% off, but also had to pay 8.75% sales tax. What was the total amount Drake paid for the skateboard?

      Draw a model to help students see that the additional cut of 10% means he paid 90% of $109.60, but then had 8.75% of that amount in tax:

      \[
      0.90(109.60) + 0.0875(0.90(109.60)) = 98.64 + 8.63 = 107.27
      \]

5. Hallie has been training for a marathon for about a year. The first time she ran a marathon she had a really slow time. The next time she ran a full marathon, she cut about 25% off her original time. The third she recorded her time in a marathon, she reduced her time second time by approximately 15%. If newest time is 3 hours and 15 minutes, what was her original time?

   a. Draw a model to represent this situation.

   Let \( x \) be her original time

   \[
   < \text{ --New time; } x - 0.25x \text{ ------------------ } \quad \text{25% reduction} >
   \]

   \[
   < \text{ 3hr 15min. or 195 minutes } >
   \]

   b. Write an equation to answer the question: \( 195 = 0.85(0.75x) \)

      The original whole \( (x) \) is her first time running. The next time is 75% (a 25% reduction) of the original time \( (0.75x \text{ or } x - 0.25x) \). The next time it’s 85% of the previous time of 0.75x; e.g. 0.85(0.75x).

   c. Solve the equation:

      \[
      x \approx 305.882 \text{ this is in minutes so it’s 305 minutes and 0.882 of a minute or about 53 seconds}
      \]

   d. Answer the question in a sentence: Hallie’s original time was almost 306 minutes, or about 5 hours, 6 minutes.
6. Alayna sells cupcakes. She currently sells 200 cupcakes a week, but now she’s advertising on several local restaurant blogs and expects business to increase by 10% each week. If her business grows 10% from the previous week each week for two weeks in a row, how many cupcakes will she be selling in 2 weeks?

This will take lots of time for students to understand.

a. Draw a model and write an expression to represent this situation:

< Diagram of cupcakes growth >

b. Find the answer to the question. 242 cupcakes

Determine whether each statement below is true or false. Use words, models or an expression/equation to justify your answer. If the statement is false, write a correct statement with the given context.

7. If Maria has 25% more money than Carlo, then Carlo has 25% less money than Maria. False. Carlo has 20% less money than Maria.

< Diagram of Maria and Carlo money growth >

8. If 40% of Ms. Eischeid’s class are boys and 60% are girls, then there are 20% more girls than boys in Ms. Eischeid’s class. False. There are 50% more girls.

< Diagram of boys and girls distribution in class >
3.3b Homework: Writing Equations to Solve Percent Problems

For each context, write an equation for the context, solve the equation and then answer the question. Draw a model to help you understand the context where necessary.

1. There were 850 students at Fort Herriman Middle School last year. The student population is expected to increase by 20% next year. What will the new population be?

   Draw a model to represent this situation.
   
   Write an equation to represent the new population.
   
   \[ x = 1.2(850) \]

   After the 20% increase, the student population next year will be 1020.

2. A refrigerator at Canyon View Appliances costs $2200. This price is a 25% mark up from the wholesale price. What was the wholesale price?

   Draw a model to represent this situation.

   Write an equation to represent the whole sale price
   
   \[ 2200 = 1.25x \]

   After the 25% increase, the wholesale price was $1760.

3. Carlos goes to Miller’s Ski Shop to buy a snowboard, because there’s a 30% off sale. When he gets to the store, he gets a coupon for an additional 20% off the sale price. If he paid $252 for the snowboard, what was the original cost?

   Draw a model to represent this situation.

   Write an equation to represent the problem situation.

   What was the original cost of the snowboard?
For each context in #4 – 6, write an equation, solve it, and write and a complete sentence to answer the question. Draw a model to assist you in understanding the context.

4. Philip took a test and missed 35% of the questions. If he missed 28 questions, how many questions were on the test?

5. Dean took his friend to lunch last week. The service was really good, so he left a tip of 20% of the total bill, the meal and tax. If he spent a total of $28.50, how much was the meal and tax?
   Let \( x = \text{price of meal + tax} \). Then \( 1.2x = 28.50 \); \( x = 23.75 \); So the meal with tax was $23.75.

6. The size of Mrs. Garcia’s class increased 20% from the beginning of the year. If there are 36 students in her class now, how many students were in her class at the beginning of the year?

   \( x = \text{number of students at the beginning of the year} \). \( x + 0.2x = 36 \) so \( x = 30 \). There were 30 students at the beginning of the year.

7. Write a context for each equation:

   \( 0.40x = 450 \)  
   \( 0.60x = 450 \)  
   \( x - 0.40x = 450 \)
   \( x = 750 \)  
   Contexts will vary.
8. Kaylee is training for a marathon. Her training regimen is to run 12 miles on Monday, increase that distance by 25% on Wednesday, and then on Saturday increase the Wednesday distance by 25%. How far will she run on Saturday?

9. Christina would like to give her brother new gloves for his birthday. She has a lot of coupons but is not sure which one to use. Her first coupon is for 50% off of the original price of one item. Normally, she would use this coupon. However, there is a promotion this week and gloves are selling for 35% off the original price. She has a coupon for an additional 20% off the sale price of any item. Which coupon will get her the lower price? She is not allowed to combine the 50% off coupon with the 20% off coupon.
   a. Draw a model to show the two different options.
      50% off coupon: 35% off sale with additional 20% off coupon:
   b. Let $x$ represent the original price of the picture frame. Write two different expressions for each option.
      50% off coupon: $x(0.5); x - x(0.5); 0.50x$
      35% off sale with additional 20% off coupon: $(0.65x)0.8; (x - 0.35x)0.8; 0.52x$
   c. Which coupon will get her the lowest price? Explain how you know your answer is correct.
      The 50% off coupon will get her the lowest price. The combination of the 35% off and then another 20% off means she would be paying 52% of the original price.
3.3c Class Activity and Homework: Word Problems with Various Forms of Rational Numbers

Use any strategy you want to answer each question. Be able to justify your answers.

1. Randy needs to hang a towel rack on a wall that’s 50 ¾ inches wide. The towel rack is 14 ½ inches wide. How far in from the edge of the wall should Randy place the ends of the towel rack if he centers it?

2. Marcela has two 16 ¾ inch wide paintings to hang on her 15 foot wide wall. She wants the paintings to be centered 25% of the way in from the left and right edge of the wall. How many inches from the edge will (a) the hook need to be placed and (b) will the edge of the frame be from the edge of the wall?

3. Bruno earns $43,250 a year. Of this amount, he pays 17.8% to taxes. Of the remainder, 1/3 is for living expenses, 2/5 for food and entertainment, and 1/4 for other insurance and car expenses. What percent of the $43,250 does Bruno have left over for miscellaneous expenses? How much money is left over?

17.8% for taxes means he has 82.2% left over: 0.822(43250) = $35,551.50
1/3 + 2/5 + 1/4 = 20/60 + 24/60 + 15/60 = 59/60 and this applies to the whole of $35,551.50. Bruno then has 1/60 of 35551.50 for misc. expenses: (1/60)×35,551.50 = 592.53.
592.53/43250 = 0.0137 so 1.37% of his total pay is available for misc. expenses.
4. There are 200 girls and 300 boys in 7th grade at Alpine Junior High. Cory learns that on Monday one-fifth of the girls and 30% of the boys in 7th grade bought school lunch.

a) How many boys and girls bought school lunch on Monday? 40 girls and 90 boys bought school lunch on Monday.

b) Did 25% of the 7th graders buy school lunch on Monday? Explain. No. A total of 130 students bought school lunch on Monday. This is 26% of the 7th grade students. We cannot “average” 20% and 30% of two different amounts. For a weighted average: 0.2(200) + 0.3(300) = x(500); 130 = x(500); x = 0.26

c) What fraction of the 7th graders bought school lunch? 13/50

5. Nicholas and Martin both have $2000. They both invest in two different mutual funds. Nicholas earns a 25% return on his investment the first year but then loses 25% of the new amount the next year. Martin loses 25% on his investment the first year, but then earns 25% on his new amount in the next year. At the end of two years, how much will each have? They both have the same amount of money, $1,875. Students will likely think they should both have $2000 again. Challenge that assumption and ask them to explain why both ended with less than they started. Also, ask what percent of their original investment do they now have; they have 93.75% of the original amount.

Would they have different ending amounts if they both started with $5000 or both started with $35? NO. For Nicholas we have 0.75(1.25(2000)) and with Martin we have 1.25(0.75(2000)). For any starting amount x, we have 0.75(1.25x) and 1.25(0.75x), both equal to 0.9375x. We might say, by the commutative property, the amounts will be the same no matter what the starting amount is OR we might say that no matter the starting amount, x, we will have 93.75% of the original amount.

Suppose Martin lost 25% on his investment the first year. What percent increase of his new amount would Martin have to earn in order to be back to his original $2000 investment? 0.75(2000)x = 2000; x = 1.3; thus, Martin would need to make 33 1/3% on his new amount to get back to his original $2000 investment.

6. Mario is taking College Algebra at the University of Utah. This final grade is weighted as follows:
   14% Homework
   18% Midterm 1
   18% Midterm 2
   18% Midterm 3
   32% Final

Mario earned 92% of the homework points which make up 14% of the overall grade: 0.92 × 0.14 = 0.1288.

Similarly, Midterm 1: 0.83 × 0.18 = 0.1494
Midterm 2: 0.79 × 0.18 = 0.1422
Midterm 3: 0.91 × 0.18 = 0.1638.

If Mario earned the following grades so far:
92% Homework
83% Midterm 1
79% Midterm 2
91% Midterm 3

All together, this makes 0.5842 or 58.42% of the total points possible. Therefore we have the equation

0.5842 + x × 0.32 = 0.90 (for A−). Solving for x:
0.32x = 0.90 − 0.5842 = 0.3158. Dividing by 0.32,

x = 0.9869 or 98.7% (rounds to 99%).

What is the lowest score Mario needs to earn on the final to earn an A− in the course if the cutoff for an A− is 90%? (Note, all scores are rounded to the nearest whole number.)
7. Wayne and Tino are both selling lemonade. Wayne’s lemonade is 70% water while Tino’s is 80% water.
   a. If Wayne has one gallon of lemonade and Tino has two gallons of lemonade and they mix it all together, what percent of the new mixture will be water?
      
      \[ 0.70(1) + 0.80(2) = x(3); \ x = 0.76; \ \text{or} \ 76 \frac{2}{3}\% \]

   b. How much lemonade would Wayne need to add to Tino’s two gallons if they wanted the lemonade to contain 75% water?
      One way students might reason: the amounts of lemonade need to be the same if we want to average 70% and 80%. Therefore, Wayne would have to contribute two gallons like Tino did. Here is a possible equation: 
      \[ 0.70x + 0.80(2) = 0.75(x + 2); \ x = 2. \]

8. A man owned 19 cars. After his death, his three children wanted to follow the instructions of his will which said: The oldest child will receive 1/2 my cars, the second child will receive 1/4 of my cars and the youngest will receive 1/5 of my cars. The three children didn’t know what to do because there was no way to follow the will without cutting up cars. Not wanting to destroy any of the cars, they decided to ask their aunt (their father’s sister) for help. She said she’d loan them one of her cars, that way they’d have 20 cars; 10 would go to the oldest, 5 to the second child and 4 to the youngest. Once they distributed the 19 cars, they could then return the car she lent them. Is this a good solution to the problem?

9. Kevin is trying to understand percents, but often gets confused. He knows that in his school 55% of the students are girls and 45% are boys. It seems to him that there are 10% more girls than boys in his school. Is he correct? Explain.
   No he is not correct. Suggest that student start by seeing what happens if there are 200 students in the school. In that case, there will be 90 boys and 110 girls; 20 more girls than boys. Twenty is 22.2% of 90, thus there are 22.2% more girls than boys. Now encourage students to generalize. There is no need to know how many students are in the school. We know that 55 is 122.2% of 45, thus the change is an increase of 22.2%.

   Percents are relative to some whole. In the context, “55% of the students are girls,” we mean 55% out of the total school population. Kevin was interested in looking at the portion of girls relative to boys NOT the total school population.

10. Ana Maria says 3/4 of the students in her class like rap music. Marco says that is 3/4% of the class. Is Marco correct?
    No. 3/4 of the class is the same as 75% of the class. 3/4% is less than 1% of the class.
3.3d Self-Assessment: Section 3.3

Consider the following skills/concepts. Rate your comfort level with each skill/concept by checking the box that best describes your progress in mastering each skill/concept. Corresponding sample problems, referenced in brackets, can be found on the following page.

Sample Problems for Section 3.3

1. Write an equation to represent each of the following word problems. Solve each problem. Express answers as fractions or decimals when appropriate.
   a. Chloe has twice as many cats as her sister has dogs. Her brother has two turtles. Together, they have five pets. How many of each pet do they have?
   b. Brian is three times older than Sydney. The sum of the ages of Brian and Sydney is eight. How old is Brian?
   c. Samantha is 8 and two-third years older than Jason. The sum of their ages is 23 years. How old is Jason?

2. Explain the meaning of the following equation that matches the given situation:

   I go to a department store with a coupon for 30% off any one item. The pants that I want are on sale for 40% off. What was the original price if I pay $21?

   \[0.70(x - 0.40x) = 21\]

3. Write an equation to represent each of the following real-life percent problems. Solve each problem. Express answers as fractions or decimals when appropriate.
   a. Victor is saving for retirement. He invested $500 plus the money his company invested for him. He earned 4% interest per year and had $780 at the end of one year. How much did his company invest for him?
   b. William and his family eat at a fancy restaurant that automatically charges 18% gratuity (tip). If his bill total is $53.02, how much was the bill before gratuity was included?
   c. Felipe saved some money in a CD with a rate of 1.5% per year. Ellie saved the same amount of money in a different CD with a rate of 0.75% interest per year. David saved \(\frac{2}{5}\) the same amount of money in a box under his bed (no interest under there). If they had $969 total after one year, how much did Felipe save to start?

Chapter 4 Proportional Relationships, Solving Problems (6 Weeks)

UTAH CORE Standard(s)
1. Compute unit rates associated with ratios of fractions, including ratios of lengths, areas and other quantities measured in like or different units. For example, if a person walks 1/2 mile in each 1/4 hour, compute the unit rate as the complex fraction $\frac{1/2}{1/4}$ miles per hour, equivalently 2 miles per hour. 7.RP.1

2. Recognize and represent proportional relationships between quantities. 7.RP.2
   a. Decide whether two quantities are in a proportional relationship, e.g., by testing for equivalent ratios in a table or graphing on a coordinate plane and observing whether the graph is a straight line through the origin. 7.RP.2a
   b. Identify the constant of proportionality (unit rate) in tables, graphs, equations, diagrams, and verbal descriptions of proportional relationships. 7.RP.2b
   c. Represent proportional relationships by equations. For example, if total cost $t$ is proportional to the number $n$ of items purchased at a constant price $p$, the relationship between the total cost and the number of items can be expressed as $t = pn$. 7.RP.2c
   d. Explain what a point $(x, y)$ on the graph of a proportional relationship means in terms of the situation, with special attention to the points $(0, 0)$ and $(1, r)$ where $r$ is the unit rate. 7.RP.2d

3. Use proportional relationships to solve multi-step ratio and percent problems. Examples: simple interest, tax, markups and markdowns, gratuities and commissions, fees, percent increase and decrease, percent error. 7.RP.3

CHAPTER OVERVIEW:
This chapter focuses on extending understanding of ratio to the development of an understanding of proportionality in order to solve one-step and multi-step problems. The chapter begins by reviewing ideas from 6th grade as well as 7th grade chapters 1 – 3 and transitioning students to algebraic representations. Students will rely on understandings developed in previous chapters and grades to finding unit rates, proportional constants, comparing rates and situations in multiple forms, writing expressions and equations, and analyzing tables and graphs. The goal is that students develop a flexible understanding of different representations of ratio and proportion to solve a variety of problems.

One important thing for teachers to note (and help students understand) is that a ratio can be written in many different ways, including part:part and part:whole. Fractions represent a part:whole relationship. Because of the overlap in expressing part:whole relationships, we often have to rely on the context to determine if a given value $a/b$ is a fraction or a ratio.

Many ratio and proportion concepts are interrelated. Therefore, at the beginning of each section, we list the key points from the 7th grade ratio and proportion standards and, below them, list the concepts and skills that will be the primary focus for the section.

VOCABULARY:
Bar model, constant of proportionality, equation, part-to-part ratio, part-to-whole ratio, percent change, proportion, proportional constant, rate table, and ratio.
CONNECTIONS TO CONTENT:

Prior Knowledge
Student should be able to draw models of part-to-part and part-to-whole relationships. From these models, students should be able to operate fluently with fractions and decimals, especially reducing fractions, representing division as a fraction, converting between mixed numbers and improper fractions, and multiplication and division with fractions. Many of these concepts were reviewed in Chapter 1 and will be reviewed briefly in this chapter. Students worked extensively on ratio in 6th grade where they learned to write ratios as fractions, using a colon, or using words.

At the beginning of this chapter, it is assumed that students can use models to solve percent, fraction and ratio problems with models. Students will connect ratio and proportional thinking to a variety of multi-step problems.

Future Knowledge
A strong foundation in proportion is key to success throughout traditional middle and high school mathematics. Further, it is essential in Trigonometry and Calculus. In the next chapter, students will use proportions as a basis for understanding scaling. In 8th grade, proportions form the basis for understanding the concept of constant rate of change (slope) and the basic measures of statistics. Also in 8th grade students will finalize their understanding of linear relationships and functions; proportional relationships studied in this chapter are a subset of these relationships. Later, in secondary math, students will solve rational equations (such as $\frac{x}{x+2} = \frac{3}{x^2-4}$), apply ratio and proportion to similarity and then to trigonometric relationships, and learn about change that is not linear.
**MATHEMATICAL PRACTICE STANDARDS (emphasized):**

<table>
<thead>
<tr>
<th>Practice</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Make sense of problems and persevere in solving them.</td>
<td>By building from simpler contexts of ratio and proportion, students develop strategies for working with multi-step problems without a clear path to a solution or containing inconvenient numbers. Additionally, students should think flexibly about the relationship between fractions, ratio and proportion and their multiple representations to solve problems. After solving a problem students should be encouraged to think about the reasonableness of the answer.</td>
</tr>
<tr>
<td>Reason abstractly and quantitatively.</td>
<td>Students will reason abstractly throughout the chapter particularly when they begin to write proportion equations and solve them algebraically. Students should be encouraged to think about the relationship between equations, tables and graphs and the contexts they represent. Students should also be encouraged to reason quantitatively throughout the chapter with the emphasis on units. When an answer is obtained, students should be able to state what the number represents. When students state a unit rate they should be able to give the units represented therein. Further, students should be able to draw models of the quantities and connect various representations to tables, graphs and equations.</td>
</tr>
<tr>
<td>Construct viable arguments and critique the reasoning of others.</td>
<td>Students should construct arguments and critique those of others’ throughout. With both, students should refer to representations of ideas and/or arithmetic properties in the construction of their arguments. Arguments should be made orally or in writing.</td>
</tr>
<tr>
<td>Model with mathematics.</td>
<td>As students study proportional relationships, they begin to see examples in their lives: traveling on the freeway at a constant rate, swimming laps, scaling a recipe, shopping, etc. Most proportional relationship from the real world can be modeled using the representations students learn in this chapter. Appropriate models include bar/tape models (either part-part-whole or comparison) or other similar representations, tables or graphs. Models selected should help to reveal relationships and structure. Further, students should be able to connect models to their algebraic representation.</td>
</tr>
<tr>
<td>Attend to precision.</td>
<td>Students should be encouraged throughout the chapter to express unit rates exactly with appropriate units of measure by using fractions and mixed numbers rather than rounded decimals. When graphing or creating tables, labeling is crucial as it is when making an argument. Vocabulary should also be used appropriately in communicating ideas.</td>
</tr>
<tr>
<td>Look for and make use of structure.</td>
<td>Students should make use of structure as they identify the unit rate from tables by looking at the relationship of values both vertically and horizontally. Additionally, students will discover that graphs of proportional linear relationships cross through the origin. When comparing proportional relationships, students should note the structure of equations and how it relates to its table and the steepness of its lines. Lastly, students should solidify their understanding of the difference between ratio and fraction in this chapter. This is an important distinction and one that will allow them to think more flexibly with either.</td>
</tr>
<tr>
<td>Use appropriate tools strategically.</td>
<td>Students continue their transition in this chapter to more abstract representations of ideas. As such, students will be working towards using symbolic representation of ideas rather than models exclusively. This transition will occur at different rates for different students. Students should be encouraged to use mental math strategically throughout. For example, if students are given a rate of 3 pounds per $2, there is no need for a calculator to determine that the unit rate is $\frac{3}{2}$ pounds per $1$ or $\frac{$2}{3}$ per pound.</td>
</tr>
<tr>
<td>Look for and express regularity in repeated reasoning.</td>
<td>Students should note repeated reasoning in rate tables and graphs throughout the chapter. They will also use repeated reasoning to uncover the unit rate associated with percentages of increase and decrease and in the relationship of ratios and fractions.</td>
</tr>
</tbody>
</table>
4.0 Anchor Problem: Purchasing Tunes-Town Music Company—What’s the Better Deal?

Problem #1:

Discounts and Markups
(Adapted from illustrative mathematics.org)

In June, Tunes-Town wasn’t making enough money to stay in business, so in July, they reduced all prices by 20% to attract more business.

They found that even at July’s prices they weren’t making enough money, so they decided they had to sell their store to Beat-Street. In August, Beat-Street took over the store and the manager immediately increased all the current (July) prices by 20%, thinking this would go back to the original prices.

1) Track the price of a $100 car stereo throughout the story. Start: $100, after 20% discount: $80, after 20% increase: $96
2) By what percentage should Beat-Street have raised prices to make August’s prices revert back to the original June prices? Use any strategy to solve. 25%

Problem #2:

What’s the Better Deal?
(From illustrative mathematics.org)

Beat-Street, Tunes-Town, and Music-Mind are music companies. Beat-Street offers to buy 1.5 million shares of Tunes-Town for $561 million. At the same time, Music-Mind offers to buy 1.5 million shares of Tunes-Town at $373 per share.

1. Who would get the better deal, Beat-Street or Music-Mind? Explain. Music-Mind would get the better deal because they would be able to purchase the same amount of stock for less money.
2. What is the total price difference? $561 – 559.5 = $1.5 million

These problems will be revisited at the end of the chapter. The goal is for students to start thinking about change and change of change. Further, students should start thinking about strategies for comparing situations. Students may use a model, table or graph as they attack these situations.
Section 4.1: Understand and Apply Unit Rates

Section Overview:

The purpose of this section is to solidify the concept of unit rates. This includes finding unit rates from contexts, tables, graphs and/or proportional relationships written as equations. This section will begin the work of helping students to move fluidly among these representations to find missing quantities. Students will visualize ratios using models—both part-part-whole and comparison tape models. Particular attention should be paid to models of rates with unlike units (for example miles and hours). Students will identify the unit rate for both units (i.e. miles per hour and hours per mile). Students should then be able to move away from using models and be able to recognize the reciprocal relationship of the two unit rates to solve problems.

Along the way, this section will practice operations with rational numbers, with particular attention paid to precision with “inconvenient” division problems that come up from ratios. Students should be encouraged to find exact unit rates; i.e. they should be encouraged to use fractions to divide numbers, rather than using long division or a calculator and getting decimals approximations. Students should understand that using a rounded unit rate will give inaccurate results when finding missing quantities.

Up until this chapter, students worked primarily with part:whole relationships (percent, fractional portions, and probability). In this section, students will begin to connect how part:whole relationships give information about part:part relationships and vice versa. In 4.4 this idea will be solidified.

Rate tables will be introduced but will be further explored and connected to graphs in the next section.

Key Ratio and Proportion Concepts from Utah Core Standards

RP Standard 1:
1. Extend the concept of a unit rate to include ratios of fractions.
2. Compute a unit rate, involving quantities measured in like or different units.

RP Standard 2:
3. Determine if two quantities expressed in a table or in a graph are in a proportional relationship.
4. Determine a unit rate from a table, graph, equation, diagram or verbal description and relate it to the constant of proportionality.
5. Write an equation for a proportional relationship in the form \( y = kx \).
6. Explain the meaning of the point \((x, y)\) in the context of a proportional relationship.
7. Explain the significance of \((0,0)\) and \((1,r)\) in a graph of a proportional relationship, where \(r\) is the unit rate.

RP Standard 3:
8. Solve multistep problems involving percent using proportional reasoning
9. Find the percent of a number and extend the concept to solving real life percent applications.
10. Calculate percent, percent increase, decrease, and error.

Primary Concepts and Skills to be Mastered in This Section

1. Compute unit rate from a context.
2. Compute a unit rate from a table of values.
3. Compare two rates to determine equivalence or to contrast differences.
4. Find the unit rate for BOTH units (i.e. miles per hour and hours per mile).
5. Use unit rate to find a missing quantity.
4.1a Class Activity: Model Ratios (Review)

What is a ratio? Students studied ratios extensively in 6th grade. They should know a ratio compares two quantities describing the same “event.” Quantities can be compared in part:part, part:whole or whole:whole.

In the space below, write as many ratios as you can find in the picture shown above. Be sure to label what you are comparing. Examples: 1:2 (1 sailboat to 2 dolphins), 3:5 (3 sailboats to 5 row boats), 1:6 (1 lighthouse to 6 dolphins). Labeling quantities is very important.

Review Reducing Ratios and Relating Ratios to Fractions and Percents This is the first time in the book that students work with part-to-part ratios. We will start by modeling ratios with part + part = whole bar models to help students see how ideas with ratio are related to fractions and percents. In Example 3, we will also use a comparison model. Both models help students to think about the relationship.

Example 1: Use a model to find ratios that are equivalent to the ratio 2 sunflowers to 6 roses.

\[
\begin{array}{c|c|c|c|c|c|c|c|c|c}
\text{2 sunflowers} & & & & & & & & & \text{6 roses} \\
\end{array}
\]

We can place two flowers into each of four groups; this reveals a 1 (group) sunflower to 3 (groups) roses.

\[
\begin{array}{c|c|c|c|c|c|c|c|c|c}
\text{sunflower} & & & & & & & & & \text{roses} \\
\end{array}
\]

The reduced ratio is 1 sunflower to 3 roses. In other words, there is 1 sunflower for every 3 roses.
We can write other equivalent ratios by increasing the number of flowers in each group as long as all the groups have the same number of flowers.

For example, 5 sunflowers to 15 roses, notice that all the groupings have five flowers.

![Diagram showing equivalent ratios](image)

The ratio is also equivalent to $\frac{1}{2}$ sunflower to $\frac{1}{2}$ roses.

Example 2: What percent of the flowers in Example 1 are sunflowers?

Because there are a total of 4 parts (1 part sunflowers and 3 parts roses) and sunflowers are 1 part of all the flowers, we know that 25% of the flowers are sunflowers. We could also say $\frac{1}{4}$ of all the flowers are sunflowers and then covert $\frac{1}{4}$ to 25%.

Working with a partner use a model to answer each question.

1. The high school has a new ski club this year. In the club there are 4 girls and 16 boys.
   a. Use a model to find the ratio of girls to boys in the skiing club. 1:4 or 1 girl to 4 boys

   ![Diagram showing ratio of girls to boys](image)

   b. What percent of the students in the ski club are girls? 20%
2. A cat has given birth to a bunch of kittens. There are 3 black cats and 6 striped cats.
   a. Use a model to find the ratio of black cats to striped cats. 1 black kitten to 2 striped kittens or 1:2
      black to striped cats.
      
      | 3 black | 3 striped |

   b. What fraction of the kittens are striped? 2/3 of the kittens are striped

3. There are 16 girls and 12 boys in Ms. Garcia’s class.
   a. What is the ratio of girls to boys in Ms. Garcia’s class? 4 girls to 3 boys or 4:3 girls to boys

   b. What is the ratio of girls to students in her class? 4 girls to 7 students

   c. Approximately, what percent of the students in Ms. Garcia’s class are boys? Approximately 43%

   d. What fractional portion of the students in Ms. Garcia’s are boys? 3/7

   e. Suppose Ms. Garcia had a huge class of 63 students at the same ratio as above. How many students
      would you expect to be boys and girls? 36 girls and 27 boys

Example 3: The ratio of girls to boys in Mrs. Jimenez’s class is 3 to 2. Create a model to represent this context.

| Girl | Girl | Girl | Boy | Boy |

We can model this situation with a part-part-whole tape model as above: three parts girls and two parts boys. In
this way we can see that there are a total of five equal parts in the whole.

Students may want to know when to use part-part-whole model and when to use the comparison model. Both are
valid models and either can be used in most situations. Occasionally the context may suggest one over the other, but
for the most part encourage students to use the model that makes the most sense to them for the context. Note: the
goal is to transition students to algebraic representation of ideas; models are simply a tool in that transition.
We might also model the situation as a comparison, where one unit of measure is 3 girls to 2 boys:

| Girl | Girl | Girl | Boy | Boy |

Boy | Boy
Example 4: Use a model to find ratios that are equivalent to the ratio 3 girls to 2 boys.

12 girls to 8 boys is equivalent to 3 girls to 2 boys, as seen in the part-part-whole tape model below.

<p>| | | | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Girl</td>
<td>Girl</td>
<td>Girl</td>
<td>Boy</td>
<td>Boy</td>
</tr>
<tr>
<td>Girl</td>
<td>Girl</td>
<td>Girl</td>
<td>Boy</td>
<td>Boy</td>
</tr>
<tr>
<td>Girl</td>
<td>Girl</td>
<td>Girl</td>
<td>Boy</td>
<td>Boy</td>
</tr>
<tr>
<td>Girl</td>
<td>Girl</td>
<td>Girl</td>
<td>Boy</td>
<td>Boy</td>
</tr>
</tbody>
</table>

The equivalent ratio 12 Girls to 8 boys can also be shown using a comparison model:

<p>| | | | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Girl</td>
<td>Girl</td>
<td>Girl</td>
<td>Boy</td>
<td>Boy</td>
</tr>
<tr>
<td>Girl</td>
<td>Girl</td>
<td>Girl</td>
<td>Boy</td>
<td>Boy</td>
</tr>
<tr>
<td>Girl</td>
<td>Girl</td>
<td>Girl</td>
<td>Boy</td>
<td>Boy</td>
</tr>
<tr>
<td>Girl</td>
<td>Girl</td>
<td>Girl</td>
<td>Boy</td>
<td>Boy</td>
</tr>
</tbody>
</table>

Both models (part-part-whole and comparison) will be used throughout this chapter; therefore, it’s important that students and teachers be comfortable with both. It’s likely that students used these or similar models in 6th grade. Discuss with students the similarities and differences of the two models. Iteration of units by different factors will be used throughout.

Since one “unit” of the ratio consists of 3 girls and 2 boys (and we don’t want to end up with parts of a child), for this problem it makes more sense to put one item (a child) into each group – in this case, five groups. However, for things that can be easily divided up, such as miles, cups of flower, gallons, etc., we can put multiple items in a group and talk about unit rate. Thus we will likely not talk about unit rate for this problem, but using this second strategy will be very useful for situations where the items can be divided up.

Other equivalent ratios include:
6 girls to 4 boys 30 girls to 20 boys 18 girls to 12 boys

4. What percent of Mrs. Jimenez’s class are girls?
60% of Mrs. Jimenez’s class are Girls. We can see that the whole has 5 parts of which 3 are girls.

5. What fractional portion of Mrs. Jimenez’s class are boys?
2/5 of Mrs. Jimenez’s class are Boys.
Spiral Review

1. Model \(-18 + 6 = -12\)

2. Simplify the following expression. Use a model if needed.
   \[9m - 3 + 4m\]

3. Which number is larger? Justify your answer. \(-6\text{ or } -4\)
   -6 is two less than -4; so -4 is larger.

4. Write this model in fraction form then simplify.
   \[\frac{35}{100}, \frac{7}{20}\]
4.1a Homework: Model Ratios (Review)

1. In the closet, there are 10 shirts and 15 skirts.
   a. Use a model to find the simplified ratio of shirts to skirts.
   b. Use the same model to find the percent of the items in the closet that are shirts.

2. In my pocket, I have 8 quarters and 6 dimes.
   a. Use a model to find the simplified ratio of quarters to dimes?
   b. What fractional portion of the coins in my pocket are dimes?

3. On the bookshelf, there are 16 paperback and 20 hardback books.
   a. Use a model to find the simplified ratio of paperback to hardback books.
   b. To the nearest whole number, find the percent of paperback books on the shelf.
      The ratio of paperback to hardback books is 4:5; Approximately 44% of the books are paperback.

4. During gym class, there are 7 footballs and 49 tennis balls.
   a. Use a model to find the simplified ratio of footballs to tennis balls.
   b. If the ratio of footballs to tennis balls stays the same and there are 21 footballs, how many tennis balls would you expect to have?

5. In the toolbox, there are 4 nails and 30 screws.
   a. Use a model to find the simplified ratio of nails to screws.
   b. What fractional portion of the items are nails?
6. In a classroom, there are 12 girls and 8 boys.
   a. What fraction of the students in the class are girls?
   b. What percent of the class are girls?

7. In the fridge, there are $2\frac{1}{2}$ bananas and 10 apples.
   a. Use a model to find the simplified ratio of apples to bananas.
   b. What percent of the class are girls?
     4:1 apples to bananas; 20% of the fruit is bananas.

8. A package of Skittles has 2 red skittles, 4 green skittles, and 4 purple skittles.
   a. Use a model to find the simplified ratio of red : green : purple candies.
   b. What percent of the skittles are purple?
   c. If the ratio of red : green : purple is always the same and there are 120 skittles in a package, how many of each color do you expect to have?

9. The ratio of rabbits to birds at the pet store is 5:2.
   a. Find three equivalent ratios and
   b. What fraction of the rabbits and birds at this pet store are birds?
     a) see answers, possibilities include 10:4, 15:6, 50:20, etc. b) 2/7

10. In a gummy bear package the ratio of red to yellow to clear gummy bears is 3:2:5.
    a. What percent of the gummy bears are yellow?
    b. What fraction of the gummy bears are clear?
4.1b Class Activity: Equivalent Ratios and Rate Tables

**Activity 1:** It takes you 3 hours to read 82 pages in your novel.
   a. At this rate, how many pages per hour do you read?
   b. If you maintain the same rate, how many pages can you read in 9 hours?
   c. How many pages can you read in 2 hours?
   a. 82/3 or 27 1/3 pages per hour; b. 246 pages; c. 54 2/3 pages in 2 hours

Let students use any method they want here. You are going to transition students from thinking about ratio in bar models to iterating on a table. You will be scaling up and down throughout this section. To start the transition, we will use models. As you engage students, questioning should focus on the structure models reveal about iterating unit groups; e.g. here the ratio is 82 pages to 3 hours, a one-third iteration (or dividing each by 3) gives 82/3 pages to 1 hour. If we iterate the ratio 3 times we get 246 pages to 9 hours. We can show this with bar models, but tables make it even easier.

In the previous section we used models to calculate ratios with similar units. You can also use models when working with rates where two attributes of the same situation are stated as a rate with *unlike units*.

**Example 1:** If you worked 5 hours and make a total of $42.30, use a model to determine how much money per hour you make.

Notice we are using a comparison model here. Both 5 hours and $42.30 are attributes of the same events; e.g. 5 hours and $42.30 are two measures of the same “thing”.

<table>
<thead>
<tr>
<th>5 hours</th>
<th>1 hour</th>
<th>1 hour</th>
<th>1 hour</th>
<th>1 hour</th>
<th>1 hour</th>
</tr>
</thead>
<tbody>
<tr>
<td>$42.30</td>
<td>$8.46</td>
<td>$8.46</td>
<td>$8.46</td>
<td>$8.46</td>
<td>$8.46</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>$42.30</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

You can use the same idea to scale up or scale down, as seen in the next example.

**Example 2:** How much will you make if you work 10 hours?

<table>
<thead>
<tr>
<th>5 hours</th>
<th>1 hour</th>
<th>1 hour</th>
<th>1 hour</th>
<th>1 hour</th>
<th>1 hour</th>
</tr>
</thead>
<tbody>
<tr>
<td>$8.46</td>
<td>$8.46</td>
<td>$8.46</td>
<td>$8.46</td>
<td>$8.46</td>
<td>$8.46</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>$42.30</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Thus, in 10 hours you will make $84.60.

Use the model to determine how much you would make in 3 hours.

$25.68
Talk to students about the benefit in finding how much you make in one hour—unit rate.

**Activity 2**: For your family reunion, you are in charge of planning a day at the lake. You want to choose a kayak rental shop near the lake, but you’re not sure how many kayaks you’ll need or how long you’ll need them. You call around to get some prices and find two shops (Paddle Heaven and Floating Oasis) close to the lake. Both shops will charge you for the exact amount of time you have the kayaks, using a constant rate. Below are the rates each shop quoted you:

<table>
<thead>
<tr>
<th>Paddle Heaven</th>
<th>Floating Oasis</th>
</tr>
</thead>
<tbody>
<tr>
<td>$92.50 every 5 hours</td>
<td>$38 every 2 hours</td>
</tr>
</tbody>
</table>

Draw a model for each kayak shop’s rate. Use the model to help you fill out the following tables. Assume that the hours and dollars keep a constant ratio.

<table>
<thead>
<tr>
<th>1 hour</th>
<th>1 hour</th>
<th>1 hour</th>
<th>1 hour</th>
<th>1 hour</th>
<th>1 hour</th>
</tr>
</thead>
<tbody>
<tr>
<td>$92.50</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>1 hour</th>
<th>1 hour</th>
<th>1 hour</th>
<th>1 hour</th>
<th>1 hour</th>
<th>1 hour</th>
</tr>
</thead>
<tbody>
<tr>
<td>$18.50</td>
<td>$18.50</td>
<td>$18.50</td>
<td>$18.50</td>
<td>$18.50</td>
<td>$18.50</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>5 hour</th>
<th>5 hour</th>
<th>5 hour</th>
<th>5 hour</th>
<th>5 hour</th>
</tr>
</thead>
<tbody>
<tr>
<td>$92.50</td>
<td>$92.50</td>
<td>$92.50</td>
<td>$92.50</td>
<td>$92.50</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>1 hour</th>
<th>1 hour</th>
</tr>
</thead>
<tbody>
<tr>
<td>$38</td>
<td>$38</td>
</tr>
</tbody>
</table>

**Paddle Heaven:**

<table>
<thead>
<tr>
<th>Hours</th>
<th>Dollars</th>
</tr>
</thead>
<tbody>
<tr>
<td>5</td>
<td>92.50</td>
</tr>
<tr>
<td>10</td>
<td>185.00</td>
</tr>
<tr>
<td>20</td>
<td>370.00</td>
</tr>
<tr>
<td>100</td>
<td>1850.00</td>
</tr>
</tbody>
</table>

**Floating Oasis:**

<table>
<thead>
<tr>
<th>Hours</th>
<th>Dollars</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>38</td>
</tr>
<tr>
<td>1</td>
<td>19</td>
</tr>
<tr>
<td>10</td>
<td>190</td>
</tr>
<tr>
<td>50</td>
<td>950</td>
</tr>
</tbody>
</table>

The Floating Oasis table is not “in order” to start students noticing that they can multiply the input by a quantity (in this case 18.50) to get the output quantity.

a) Which company is cheaper? Justify your answer. Paddle Haven. Answers may vary: price per hour for Paddle Haven is $18.50 and $19 for Floating Oasis

b) You decide to use Floating Oasis because it is closer to your family’s campground. How much would it cost if you rented one kayak for 33 hours?

$627

c) Challenge: If you only had $1, approximately how long would you be able to kayak from either shop? Approximately 1/19\textsuperscript{th} of an hour, or about 3 minutes.

d) Challenge: If you budgeted $150 for kayaks, approximately how long would you be able to kayak from either shop?

A little less than 8 hours.
Activity 3: A hiker backpacking through the mountains walks at a constant rate. Below is a rate table with how many miles she walked and the hours it took. From the table: a) write as many equivalent ratios as you can and b) write the rate of miles per hour in simplest form.

<table>
<thead>
<tr>
<th>Miles</th>
<th>Hours</th>
</tr>
</thead>
<tbody>
<tr>
<td>24</td>
<td>8</td>
</tr>
<tr>
<td>6</td>
<td>2</td>
</tr>
<tr>
<td>1</td>
<td>1/3</td>
</tr>
<tr>
<td>3</td>
<td>1</td>
</tr>
</tbody>
</table>

Students may write the ratio with a colon, “to” or as a fraction. Emphasize units, equivalence and that the ratio is a relationship between given quantities.

24 miles : 8 hours 1 mile per 1/3 hour
the ratio of miles to hours is 3 : 1
6 miles to 2 hours

What patterns do you see in the table? Draw a model to justify. The number of miles is 3 times the number of hours. Whatever number in the 1st column was multiplied by to go down to the next row, the corresponding number in the 2nd column was also multiplied by; e.g. 24 ×1/4 = 6 and 8 × ¼ = 2.

For each table below one ratio is given; fill in the missing values. Use a model to confirm your method.

4. Servings | Ounces |
<table>
<thead>
<tr>
<th></th>
<th></th>

Spiral Review

1. Order the following rational numbers from least to greatest. \(\frac{12}{3}, 4.5, \frac{14}{3}, .94, \frac{12}{3}, 4.5, \frac{14}{3}, .94\)

2. What is the opposite of 7? -7

3. What is 35% of 120? Use a bar model. 42

4. Without using a calculator, determine which fraction is bigger in each pair. Justify your answer with a picture and words.
   a. \(\frac{5}{7}\) or \(\frac{3}{5}\)
   b. \(\frac{6}{12}\) or \(\frac{8}{14}\)
### 4.1b Homework: Equivalent Ratios and Rate Tables

For each table below one ratio is given; fill in the missing values. Draw a model to confirm your calculation.

1. **Rose bushes** | **Square feet of garden**
   | 60 | 40 |
   | 30 |    |
   | 100|    |
   | 1  |    |

2. **Scoops of corn** | **Number of deer fed**
   | 1.5 | 1 |
   | 5   |   |
   | 10  | 30 |

3. **Hours** | **Distance travelled (km)**
   | 1  | 15 |
   | 1/2|   |
   | 1  | 30 |
   | 1/3| 10 |
   | 10/3| 100 |

4. **Hours worked** | **Lawns mowed**
   | 6  | 8 |
   | 0.75 | 1 |
   | 3.75 | 5 |
   | 5.25 | 7 |

5. **Minutes** | **Gallons in the pool**
   | 90 | 54 |
   | 10 |   |
   | 3  | 1 |

6. **Acres** | **Houses**
   | 1 | 1 |
   | 4 |   |
   | 1 | 100 |
   | 100 |   |
4.1c Class Activity: Model and Understand Unit Rates

Activity 1: Fill in the missing information for each. Then compare the rate tables:

<table>
<thead>
<tr>
<th>Miles</th>
<th>Hours</th>
</tr>
</thead>
<tbody>
<tr>
<td>60</td>
<td>48</td>
</tr>
<tr>
<td>8.75</td>
<td>7</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Miles</th>
<th>Hours</th>
</tr>
</thead>
<tbody>
<tr>
<td>$\frac{1}{4}$</td>
<td>1</td>
</tr>
<tr>
<td>8.75</td>
<td>7</td>
</tr>
</tbody>
</table>

What do you notice?

**Introduce the term “unit rate.”** Ask students what they think that might mean.
Recall: Example 1 in 4.1a, the ratio of sunflowers to roses.

In that example, we found that the reduced ratio of sunflowers to roses is 1 sunflower to 3 roses. Another way to model that reduced ratio is:

$$\frac{2 \text{ Sunflowers}}{6 \text{ Roses}} = \frac{1 \text{ Sunflowers}}{3 \text{ Roses}} = \frac{1}{3} \text{ Sunflower per 1 Rose}$$

What if we wanted to know the ratio of sunflowers to 1 rose?

Notice here that the ratio is being written in a fraction. Careful attention must be taken early on to distinguish a fraction from a ratio. A fraction is a rational number relative to a unit. A ratio describes the relationship between things OR is two measures of the same event.

The relationship between sunflowers and roses here is that 1 sunflower to three roses, or $\frac{1}{3}$ sunflower to each rose. The ratios $1:3$ and $1/3:1$ are equivalent.

You are also extending the idea of ratio to rate more explicitly from here out. In other words, the ratio $1/3:1$ for sunflowers to roses tells us that for every increase of 1 rose, there will be a $\frac{1}{3}$ increase in sunflowers. Thus if there are 30 roses, there will be 10 sunflowers.

Thus, the unit rate (the ratio of the first quantity per one of the second quantity) of sunflowers to roses is $\frac{1}{3}$ of a sunflower per 1 rose.
We can also find the unit rate for roses to sunflowers.

\[
\frac{6 \text{ Roses}}{2 \text{ Sunflowers}} = \frac{3 \text{ Roses}}{1 \text{ Sunflowers}}
\]

Here, the unit rate is 3 roses per 1 sunflower.

**Activity 2:** John walks at a constant rate of 8 miles every 3 hours. Answer the following:

1. What is the rate written as miles per hours? \( \text{_____miles : _____hours} \) \( 8 \text{miles:3hours} \)

2. Use a bar model to find the unit rate of miles per hour. \( \text{_____miles : 1 hour} \) \( \frac{8}{3} \text{miles:1hour} \)

3. How far can John walk in 5 hours? \( 5 \text{ hours} \times \left( \frac{8}{3} \text{ miles per hour} \right) \) is 40/3 miles or 13 1/3 miles. In later sections, unit analysis will be discussed more (in this case, hour \( \times \) miles/hour = miles). For now, simply help students understand that if John travels 8/3 miles in one hour, we can multiply this quantity by 3 to find the distance traveled in 3 hours. Help students “count” by 8/3 i.e. 8/3, 16/3, 24/3 etc. It may be helpful to show the jumps on a number line.

4. Fill in the following table

<table>
<thead>
<tr>
<th>Miles (mi)</th>
<th>0</th>
<th>8/3</th>
<th>16/3</th>
<th>( \frac{24}{3} = 8 )</th>
<th>32/3</th>
<th>40/3</th>
<th>( \frac{48}{3} = 16 )</th>
<th>80/3</th>
<th>160/3</th>
<th>( \frac{(8}{3})h )</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hours (h)</td>
<td>0</td>
<td>1</td>
<td>2</td>
<td>3</td>
<td>4</td>
<td>5</td>
<td>6</td>
<td>10</td>
<td>20</td>
<td>h</td>
</tr>
</tbody>
</table>
5. Where on the table can you find the unit rate for miles per hour? At 1 hour, he travels 8/3 miles.

6. Use a model to find how long would it take John to walk 1 mile? Write this as a unit rate: \( \frac{3}{8} \text{ hours} \) \( \frac{1}{1 \text{ mile}} \)

John travels 8/3 miles in one hour. That means there are eight 1/3 miles each hour, so we can think of the hour divided into 8 parts. The top row is eight 1/3 miles and the bottom is eight 1/8 hours. It takes 3/8 of an hour to go 3/3 miles—3/3 miles is one mile.

7. Fill in the following table:

<table>
<thead>
<tr>
<th>Hours (h)</th>
<th>0</th>
<th>3/8</th>
<th>6/8</th>
<th>9/8</th>
<th>12/8</th>
<th>15/8</th>
<th>18/8</th>
<th>21/8</th>
<th>24/8 (=3)</th>
<th>27/8</th>
<th>30/8</th>
<th>60/8</th>
<th>(3/8)m</th>
</tr>
</thead>
<tbody>
<tr>
<td>Miles (m)</td>
<td>0</td>
<td>1</td>
<td>2</td>
<td>3</td>
<td>4</td>
<td>5</td>
<td>6</td>
<td>7</td>
<td>8</td>
<td>9</td>
<td>10</td>
<td>20</td>
<td>m</td>
</tr>
</tbody>
</table>

8. Where on the table can you find the unit rate for hours per mile? At 1 mile, 3/8 hour per 1 mile.

9. Complete each sentence:

   The number of miles is equal to \( \frac{8}{3} \) the number of hours.

   The number of hours is equal to \( \frac{3}{8} \) the number of miles.

What is the relationship between miles per hour and hour per mile? How might this help you? They are reciprocals. Go back to the 1/3 sunflowers : 1 rose and 3 roses : 1 sunflower example at the beginning of this section for discussion.
Practice: for #1 – 4, use models to write two possible unit rates for each given situation. Be sure to include units of measure in your unit rate.

Models have been encouraged here because many students struggle with fractions. Help students connect models to algorithms for multiplying and dividing fractions.

1. The sandwich shop uses 24 slices of meat for every six sandwiches.
   4 slices of meat per sandwich; 1/4 sandwich per slice of meat.

2. It took \( \frac{3}{4} \) of a cake to feed \( \frac{1}{3} \) of the class.
   2.25 cakes per class or 9/4 cakes per class; \( \frac{4}{9} \) (0.44...) of the class per cake.

3. Each \( \frac{1}{2} \) hour the temperature of the water raises \( \frac{1}{5} \) degree.
   2.5 hours per degree or 5/2 hours per degree; \( \frac{2}{5} \) (0.4) hours per degree.

4. The ant crawls 2/3 meters every 1/4 minute.
   8/3 meters per minute; 3/8 minute per meter

*To some students it may make more sense to talk about 8/3 meters crawled every 1 minute. Talk to students about flexibility in thinking.

Spiral Review

1. Mark has $16 more than Becca. Represent how much money Mark has.
   \( b \) is the amount of money Becca has. Then Mark has \( b + 16 \) dollars.

2. What property is shown?
   \( 8 + 7 + 2 \) and \( 8 + 2 + 7 \) \( \text{commutative of addition} \) \( \text{________} \)
   \( 18 + 0 \) and \( 0 + 18 \) \( \text{identity property of addition} \) \( \text{____} \)

3. Add \( -\frac{3}{5} + \frac{2}{3} \) = \( \frac{1}{15} \)

4. Add \( -4 + -7 = -11 \)
4.1c Homework: Model and Understand Unit Rates

Use models to help you write the two possible unit rates for each given situation. Be sure to label the units in the unit rate.

1. Tony Parker scored 6 points in every quarter of a game.
   
   24 points per game
   1/24 \( (0.041\overline{6}) \) of the game per point.
   Talk about what this means; about 1 point every 2 minutes.

2. A car traveled 18 miles on \( \frac{3}{4} \) of a gallon of gas.

3. A computer company can inspect 12 laptops in 8 hours.

4. Samantha can type 14 sentences in \( 3 \frac{1}{2} \) minutes.

5. John can mow \( \frac{2}{5} \) of a lawn in \( \frac{2}{3} \) of an hour.
   
   3/5 of the lawn per hour.
   5/3 hour per lawn.
4.1d Classwork: More with Unit Rates

Find each unit rate for the situations. Be prepared to justify your answer with a model.

Activity 1: Mauricio sometimes swims laps at his local recreation center for exercise. He wants to check whether he is swimming laps faster over time. When he first starts swimming, he can swim a 100 meter lap in 90 seconds. Fill in his unit rate for laps per second (which could be a fraction) and his unit rate for seconds per lap (which could be a mixed number).

<table>
<thead>
<tr>
<th>Number of laps</th>
<th>1 lap</th>
<th>8 laps</th>
<th>5 laps</th>
<th>10 laps</th>
</tr>
</thead>
<tbody>
<tr>
<td>Time spent swimming</td>
<td>90 seconds</td>
<td>600 seconds</td>
<td>390 seconds</td>
<td>720 seconds</td>
</tr>
<tr>
<td>Laps per second</td>
<td>1/90 (≈0.0111)</td>
<td>1/75 (≈0.01333)</td>
<td>1/78 (≈0.0128)</td>
<td>1/72 (≈0.0139)</td>
</tr>
<tr>
<td>Seconds per lap</td>
<td>90</td>
<td>75</td>
<td>78</td>
<td>72</td>
</tr>
</tbody>
</table>

Which set of laps had the fastest pace? Explain your answer.
Notice that this is not a rate table that shows a proportional relationship, since each pair of numbers has a different rate. This is meant to show that a unit rate makes it easier to compare which rate is faster.

The last is the fastest because he can complete each lap in the shortest time.

1. You can buy 8 apples for $2.00.
   a. Find the unit rate for 1 apple. $0.25 per apple.
   b. Find the unit rate for $1. 4 apples per dollar.

2. The flight from Oakland to Salt Lake City was 720 miles and took 180 minutes.
   a. Find the unit rate for 1 minute. 4 miles per minute.
   b. Find the unit rate for 1 mile. 1/4 minute per mile.

3. At the store, you can get 15 cans of peaches for $3.
   a. Find the unit rate for $1. 5 cans per dollar.
   b. Find the unit rate for 1 can. $0.20 per can.

4. Traveling between countries means exchanging currencies (money). Suppose the exchange rate is 3 dollars to 2 Euros.
   a. How many Euros would you receive in exchange for 1 dollar (the unit rate for $1)?
   b. How many dollars would a person receive in exchange for 1 Euro (the unit rate for 1 Euro)?
      2/3 Euro per dollar.
      3/2 dollar per Euro.

5. Emina can swim $\frac{1}{2}$ mile in $\frac{1}{4}$ hour.
   a. What is her average rate per hour? 2 miles per hour.
   b. What is her average time per mile? 1/2 hour per mile.
6. In \( \frac{1}{10} \) of an hour, Jane can clean \( \frac{5}{8} \) of a window.
   a. What is her average rate per hour? \( 6.25 \) (25/4) windows per hour.
   b. What is her average time per window? \( 0.16 \) (4/25) hours per window.

7. Henry eats \( 2 \frac{3}{4} \) slices of pizza in 20 minutes.
   a. What is his average time per slice? \( 80/11 \) (≈7.27) minutes per slice.
   b. What is his average number of slices per minute? \( 11/80 \) (≈0.14) slices per minute.

8. In 9 minutes, Guillermo reads \( 7 \frac{1}{2} \) pages of the novel.
   a. What is Guillermo’s average reading rate in pages per minute? \( 5/6 \) pages per minute.
   b. What is Guillermo’s average reading rate in minutes per page? \( 6/5 \) minutes per page.

Write unit rates in two ways. Pick the most useful unit rate for each situation (choose out of the two possibilities) and explain. For example choose between “pounds in one bag of flour” or “bags of flour in one pound.”

<table>
<thead>
<tr>
<th></th>
<th>Unit rate a</th>
<th>Unit rate b</th>
<th>Pick the more useful unit rate, if you think one is more useful than the other. Explain your choice.</th>
</tr>
</thead>
<tbody>
<tr>
<td>9. The bakery has 8 bags of flour weighing a total of 40 pounds.</td>
<td>5 lbs per bag.</td>
<td>1/5 bag per pound.</td>
<td>See student responses.</td>
</tr>
<tr>
<td>10. In four tennis ball cans, you got 12 tennis balls.</td>
<td>3 balls per can.</td>
<td>1/3 can per ball.</td>
<td>See student responses.</td>
</tr>
<tr>
<td>11. Your dad bought 4 gallons of gas for $13.</td>
<td>$3.25 per gallon.</td>
<td>4/13 (≈0.31) gallon per dollar.</td>
<td>See student responses.</td>
</tr>
</tbody>
</table>
12. In ½ hour, you can walk 2 miles.

| 4 miles per hour. | 1/4 hour per mile. | See student responses. |

13. Marco went 300 miles in 5 hours on his road trip.

| 60 miles per hour. | 1/60 (≈0.017) hours per mile, or 1 minute per mile. | See student responses. |

Spiral Review

1. You can buy a 12 cans for $2.40.
   - Find the unit rate for 1 can. $0.20 per can.
   - Find the unit rate for $1. 5 cans per dollar.

2. Use long division to show how you can convert this fraction to a decimal and then a percent

\[
\begin{array}{c|c}
2 & 2.857142857142857143 \\
7 & \\
\hline
2 & 0.00 \\
1 & 4 \\
\hline
6 & 0 \\
5 & 6 \\
4 & 0 \\
3 & 5 \\
\end{array}
\]

.2857 or .29, 29%

3. Solve: \( \frac{3}{4} - \frac{7}{8} = -\frac{1}{8} \)

4. Simplify: \( x + 3x - 7x + 2x^2 \) -3x + 2x^2
4.1d Homework: More with Unit Rates

Find each unit rate. (Don’t forget to label)

1. You can buy 5 oranges for $2.00.
   a. What is the unit rate for 1 orange?
   b. What is the unit rate for $1?

2. For three people, there are 5 candy bars.
   a. What is the unit rate for the number of candy bars for 1 person? 5/3 candy bars per person.
   b. What is the unit rate for the number of people for 1 candy bar? 3/5 people per candy bar.

3. In $12\frac{1}{2}$ minutes, Dulce read 50 pages.
   a. On average, how many pages did she read per minute?
   b. On average, how many minutes does it take to read one page?

4. Yazmin’s heart rate was measured at 19 beats in a $1\frac{1}{4}$ minute.
   a. How many beats per minute? 76 beats per minute.
   b. How many minutes per beat? $\frac{1}{76}$ (≈0.013) minutes per beat.

5. Traveling between countries means exchanging currencies (money). Look up the current exchange rate for Europe (or replace Euros with the currency of a country of your choice).
   a. How many Euros would you receive for 1 dollar? How many Euros will you receive for $10?
   b. How many dollars would a European receive for 1 Euro? How many dollars would they receive for 10 Euros?
Write unit rates in two ways. Pick the most useful unit rate (you choose) and explain.

<table>
<thead>
<tr>
<th></th>
<th>Unit rate a</th>
<th>Unit rate b</th>
<th>Pick the more useful unit rate, if you think one is more useful than the other. Explain your choice.</th>
</tr>
</thead>
<tbody>
<tr>
<td>6</td>
<td>In 8 hours, Mayra can mow 5 lawns.</td>
<td>8/5 hours per lawn.</td>
<td>Responses may vary.</td>
</tr>
<tr>
<td>7</td>
<td>George can eat 30 hotdogs in 2 hours.</td>
<td>5/8 lawn per hour.</td>
<td></td>
</tr>
<tr>
<td>8</td>
<td>A tree grows 15.5 feet in 10 years.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>9</td>
<td>Over five years, Luz has collected 25 buttons.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>10</td>
<td>After a 2 1/2 hour rainstorm, there are 5 inches of water in a bucket.</td>
<td>2 inches per hour.</td>
<td>See student responses.</td>
</tr>
<tr>
<td>11</td>
<td>Estefania can run 3/4 the race in 2/3 of an hour</td>
<td>½ hour per inch.</td>
<td></td>
</tr>
</tbody>
</table>
4.1e Extra Practice: Complex Fraction Unit Rates

1. Diego can swim \( \frac{1}{2} \) of a mile in \( \frac{2}{3} \) of an hour.
   a) What is his rate in miles per hour?

   Use a picture or model:

   \( \frac{3}{4} \) mile per hour.

   b) What is his rate in hours per mile?

   Use a picture or model:

   \( \frac{4}{3} \) hours per mile.

2. In 20 minutes, I ate \( 1\frac{1}{2} \) sub sandwiches. What is my rate in sandwiches per hour?

   Use a picture or model:

3. Bob ate \( 3\frac{3}{4} \) sandwiches in 25 minutes. What is his rate in sandwiches per hour?

   Use a picture or model:
Use two different methods to solve each of the following problems. Show all your work!

4. In $2\frac{1}{2}$ days Raul can paint $6\frac{1}{2}$ offices. How many offices per day is he painting? Show your work!

5. Napoleon earns $4\frac{1}{2}$ dollars in 5 hours. How much does he make per hour?

6. At the 4th of July Fun Run, I ran $3\frac{1}{2}$ miles in $\frac{3}{4}$ of an hour. On average, how fast is that?

   $4\frac{3}{5}$ miles per hour.

7. In 30 days I lost $8\frac{1}{2}$ pounds. How many pounds per week is that, on average?
8. Oscar put $2\frac{3}{4}$ puzzles together in 6 nights.
   a) How many puzzles per night?
      
      \[ \frac{11}{24} \approx 0.46 \] puzzles per night.

   b) How many nights per puzzle?
      
      \[ \frac{24}{11} \approx 2.18 \] nights per puzzle.

9. In 10 hours, Henry harvested $3\frac{3}{2}$ fields of corn.
   a) How many fields per hour is that?

   b) If a working day is 8 hours, how many fields can he harvest in a working day?

10. Francisco can read 7.5 books in 5 weeks.
    a) What is his rate in books per week?

    b) How can you use the rate of books per week to calculate the number of books read in $8\frac{1}{7}$ weeks?
4.1f Class Activity: Compare Unit Rates

I. Find Unit Rates Practice (round to nearest hundredth, if needed)

<table>
<thead>
<tr>
<th>Ratio</th>
<th>Rate (Ratio as a fraction)</th>
<th>Unit Rate</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. 7 hours to drive 228 miles.</td>
<td>( \frac{228 \text{ miles}}{7 \text{ hours}} )</td>
<td>( \approx 32.57 \text{ miles per hour} ) or ( \approx \frac{32.57 \text{ miles}}{1 \text{ hour}} )</td>
</tr>
<tr>
<td>2. 375 students for 12 teachers</td>
<td>( \frac{375 \text{ students}}{12 \text{ teachers}} )</td>
<td>31.25 students per teacher.</td>
</tr>
<tr>
<td>3. $47.95 for 7 hours work</td>
<td>( \frac{$47.95}{7 \text{ hours}} )</td>
<td>$6.85 per hour.</td>
</tr>
<tr>
<td>4. 1 dozen bagels for $5.40 (price per bagel)</td>
<td>( \frac{$5.40}{12 \text{ bagels}} )</td>
<td>$0.45 per bagel.</td>
</tr>
<tr>
<td>5. $19.87 for 5 pounds of turkey. (price per pound)</td>
<td>( \frac{$19.87}{5 \text{ lbs}} )</td>
<td>( \approx $3.97 \text{ per pound} )</td>
</tr>
<tr>
<td>6. 5 ounces of chicken for $2.59 (price per ounce)</td>
<td>( \frac{$2.59}{5 \text{ ounces}} )</td>
<td>( \approx $0.52 \text{ per ounce} )</td>
</tr>
<tr>
<td>7. ( \frac{5\frac{1}{2}}{2} ) blankets in 11 hours</td>
<td>( \frac{5.5 \text{ blankets}}{11 \text{ hours}} )</td>
<td>( \frac{1}{2} ) blanket per hour.</td>
</tr>
<tr>
<td>8. 2.2 Liters of soda for $2.19 (price per liter)</td>
<td>( \frac{$2.19}{2.2 \text{ liters}} )</td>
<td>( \approx $1 \text{ per liter} )</td>
</tr>
</tbody>
</table>

II. Compare Unit Rates: Justify your comparisons.

9. Jean sells M&Ms to friends at 4 for 5 cents. The machine at the store sells 9 for 25 cents. Which is the better deal?
   Jean: 1.25¢ per M&M
   Store: \( \approx 2.78¢ \text{ per M&M} \)
   Jean has the better deal.

10. Frosted Flakes has 11 grams sugar per ounce and Raisin Bran 13 grams per 1.4 ounces. Which cereal has more sugar per ounce?
    Raisin Bran: \( \approx 9.3 \text{ grams per oz.} \)
    Frosted Flakes has more sugar.

11. Tom sells baseball cards at 10 for 35 cents. Is that a better deal than 12 for 40 cents?
    Tom: 3.5¢ per card
    Or: \( \approx 3.3¢ \text{ per card} \)
    12 cards for 40¢ is the better deal.

12. The hardware store sells 4th of July sparklers for 19 cents each. The fireworks stand charges 85 cents for four. Where would you purchase sparklers?
    Stand: \( \approx 21¢ \text{ per sparkler.} \)
    The hardware store has the better deal.

13. Ribbon: 5 m for $6.45 or 240 cm for $3.19. Which ribbon is cheaper per meter?
    5m: \( \approx $1.29 \text{ per m} \)
    240cm: \( \approx $1.33 \text{ per m} \)
    The 5m for $6.45 is the better deal.

14. An 11 ounce can of condensed soup (add 1 can of water), costs $1.45. A 20 ounce can of ready to serve soup costs $1.29. Which can of soup has the best price per ounce?
    11oz: \( \approx 6.6¢ \text{ per oz.} \)
    20oz: \( \approx 6.5¢ \text{ per oz.} \)
    The 20oz can is the better deal.
Spiral Review

1. Luis went to a soccer game with some friends. He bought two sodas for $1.50 each and four giant candy bars for $2.25 each. How much did he spend?

   \[2(1.50) + 4(2.25) = 12.00\]

2. Juliana bought 3 bags of chips and 3 sodas for herself and two friends. The chips were $0.85 a bag; if she spent a total of $6, how much was each can of soda? $1.15

3. Simplify the following expression. Use a model if needed.

   \[71b - 4a + 4b + 4a = 75b - 8a\]

4. Write a context for the following expression: \[4(x - 3)\]
4.1f Homework: Compare Unit Rates

I. Find unit rates practice (round if needed)

<table>
<thead>
<tr>
<th>Ratio</th>
<th>Rate (Ratio as a fraction)</th>
<th>Unit Rate</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. 63 sit-ups in $3 \frac{1}{2}$ minutes</td>
<td>$\frac{63 \text{ situps}}{3.5 \text{ minutes}}$</td>
<td>18 situps per minute.</td>
</tr>
<tr>
<td>2. 8 minutes to read 500 words</td>
<td></td>
<td></td>
</tr>
<tr>
<td>3. 216 miles on 17 gallons of gas</td>
<td></td>
<td></td>
</tr>
<tr>
<td>4. 36 commercials in 2 hours of TV</td>
<td></td>
<td></td>
</tr>
<tr>
<td>5. 64 ounces of orange juice for $2.79</td>
<td>$\frac{2.79}{64 \text{ ounces}}$</td>
<td>$\approx 4.4\text{¢ per ounce.}$</td>
</tr>
<tr>
<td>6. $28.45$ for 5 pounds of roast beef</td>
<td></td>
<td></td>
</tr>
<tr>
<td>7. 16 ounces of spaghetti for $0.50</td>
<td></td>
<td></td>
</tr>
<tr>
<td>8. 24 cans of cat food for $7.60</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

II. Compare Unit Rates: Justify your comparisons. (Example: Which is the better buy? Why?)

9. Applesauce: 24 oz for $1.25 or 16 oz for $0.89
   $\approx 5.2\text{¢ per oz}$
   $\approx 5.6\text{¢ per oz}$
   24 oz for $1.25$ is the better buy.

10. Grape juice: $\frac{1}{2}$ gal for $2.80$ or 20 oz. for $0.75$. (Note: there are 128 fluid oz. in a gallon).

11. Olive oil: 3 L for $16.99$ or 500 ml for $3.09$

12. Ground beef: 4.3 kg for $21.70$ or 1.6 kg for $7.85$

13. Greeting cards: 3 boxes of 12 for $30$ or 4 boxes of 15 for $49$
    $\approx 83\text{¢ per card}$
    $\approx 82\text{¢ per card}$
    4 boxes for $49$ is the better deal.

4.1g Classroom Activity: Using Unit Rates

Use the tables to identify the proportional constants (unit rates). Then use the unit rate to answer additional information. Models may be useful.

1.

<table>
<thead>
<tr>
<th>Cups of flour</th>
<th>2</th>
<th>4</th>
<th>6</th>
<th>8</th>
<th>10</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of</td>
<td>12</td>
<td>24</td>
<td>36</td>
<td>48</td>
<td>60</td>
</tr>
<tr>
<td>Cookies</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

What is the unit rate of cups of flour per cookie? 1/6 cup of flour per cookie.

How many cups of flour would be used for 20 cookies? 3⅓ cups of flour.

What is the unit rate of cookies per cups of flour? 6 cookies per cup of flour.

How many cookies could be made with 5 cups of flour? 30 cookies.

How many cookies could be made with 0 cups of flour? 0 cookies.

2.

<table>
<thead>
<tr>
<th>Inches of snowfall</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hours</td>
<td>1/2</td>
<td>1</td>
<td>3/2</td>
<td>2</td>
<td>5/2</td>
</tr>
</tbody>
</table>

What is the unit rate of inches per hour? 2 inches per hour.

At this rate, how many inches of snow would have fallen in $2\frac{1}{3}$ hours? 4⅔ inches.

What is the unit rate of hours per inch? ½ hour per inch.

At this rate, if there is $7\frac{1}{2}$ inches of snow, how long has it been snowing? 3¾ hours.

3.

<table>
<thead>
<tr>
<th>Dollars</th>
<th>3</th>
<th>4.50</th>
<th>6</th>
<th>7.50</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pesos</td>
<td>1</td>
<td>1.5</td>
<td>2</td>
<td>2.5</td>
</tr>
</tbody>
</table>

What is the unit rate of pesos per dollars? ½ peso per dollar.

At this rate, how many pesos could you get for 8 dollars? 2⅓ pesos.

What is the unit rate of dollars per pesos? 3 dollars per peso.

At this rate, how many dollars could you get for 18.60 pesos? $55.80.

If you have 0 pesos, how many dollars is that worth? 0 dollars.

Proportional constant and unit rate will have the same value, we simply use the terms in different contexts.
4. | Homeruns | 1 | 2 | 3 | 4 | 5  
|----------|---|---|---|---|---
| Swings   | 7 | 14| 21| 28| 35

What is the unit rate of homeruns per swing? \( \frac{1}{7} \) homeruns per swing.
At this rate, if the batter swings 30 times, estimate the number of homeruns he would have gotten. \( \approx 4 \)
What is the unit rate of swings per homerun? 7 swings per homerun.
At this rate, if the batter has gotten 9 home runs, how many times did he swing? 63 swings.

5. | Hours | 0 | 1 | 2 | 3 | 4  
|-------|---|---|---|---|---
| Plumbing Cost | $45 | $70 | $95 | $120 | $145 |

What is different about this table? It has a value of $45 for 0 hours.
Is there a unit rate? Justify your answer. No: \( \frac{0}{45}, \frac{1}{70}, \frac{1}{47.50}, \frac{1}{40}, \frac{1}{36.2} \)
Do you think this data is continually proportional? Why or why not? No. See student responses. May include \( \frac{70}{1} = 70, \frac{95}{2} = 47.5 \) so not the same rate throughout.
4.1h Unit Rate Projects:

I. Your Reading Rates

What is your reading rate? How long will it take you to read a book (you pick the book)? Use your group plan and be prepared to show your steps and your work.

1. Each member of your group will pick a different book.
2. Brainstorm with your group to come up with strategies for estimating how long it will take you to read your specific book.
3. Create a group plan (steps to follow at home). Be certain to include the following:
   a. What unit rates will you need to use to help you make this estimate?
   b. How will time be measured?
   c. What steps will be recorded?
   d. What work will need to be shown?
4. Make certain each member of the group has a copy of the plan.
5. Tomorrow, each member of the group will explain his/her steps and reading rate.

II. Grocery Store Comparisons

For this project, you will collect data about three products in your local grocery store. If you are unable to go to the store, use the ads that come in the newspaper or mail or check online for your local grocery store ad. Ads used must be attached to this worksheet. Choose from the following two kinds of comparisons.

1. Choose a product that comes in two sizes. Record the price and measurement (amount) of each size. Compute and compare the unit price for each product. Then tell which product is the best buy.

2. Choose two different brands of a product that comes in the same size. Record the price and measurement (amount) of each. Compute and compare the unit price of each product. Then tell which product is the best buy, explaining your reasoning.

3. Pick something you’d like to buy for yourself. Compare brands or sizes. Compute and compare the unit price for each product. Then tell which product you would choose and why.
4.1i Unit Rate Review

Answer the questions below using unit rates. Models may be helpful in answer each. Justify your answer in words, models and/or numeric expressions.

1. Arturo can run $1 \frac{3}{4}$ miles in $\frac{1}{4}$ hour. What is his speed in miles per hour?
   
   \[7 \text{ miles per hour.}\]

2. In 2.5 hours, Daniel’s brother can ride 40 miles on his bike. How fast is he going in miles per hour?

3. There were 7 inches of rain in 24 hours. What is the average amount of rain per hour?
   
   \[\frac{7}{24} \approx 0.29 \text{ inches per hour.}\]

4. The table below shows the number of parts produced by a worker on an assembly line.

<table>
<thead>
<tr>
<th># of Parts</th>
<th>24</th>
<th>36</th>
<th>42</th>
<th>54</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hours</td>
<td>4</td>
<td>6</td>
<td>7</td>
<td>9</td>
</tr>
</tbody>
</table>

   What is the unit rate between parts and hours?

5. Allyson measures her plant every year. It’s now 16 years old and it measures 12 inches. What is the unit rate for the plant growth per year?

6. The times for three runners in three different races are given in the table.

<table>
<thead>
<tr>
<th>Runner</th>
<th>Distance</th>
<th>Time</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>5 kilometers</td>
<td>34 minutes</td>
</tr>
<tr>
<td>B</td>
<td>10 kilometers</td>
<td>62 minutes</td>
</tr>
<tr>
<td>C</td>
<td>21 kilometers</td>
<td>155 minutes</td>
</tr>
</tbody>
</table>

   Which runner finished the race at the fastest average rate? A \approx 0.15 \text{ km/min}, B \approx 0.16 \text{ km/min}, C \approx 0.14 \text{ km/min}
   
   Runner B finished at the fastest rate.

7. CD Express offers 4 CDs for $60. Music Place charges $75 for 6 CDs. Which store offers the better buy?

8. Tia is painting her house. She paints $34 \frac{1}{2}$ square feet in $\frac{3}{4}$ hour. At this rate, how many square feet can she paint each hour?

9. In $1 \frac{1}{2}$ hours, Sebastian can walk $4 \frac{1}{2}$ miles. Find his average speed in miles per hour.

   \[3 \text{ miles per hour.}\]
10. Mrs. Rossi needs to buy dish soap. There are four different sized containers.

<table>
<thead>
<tr>
<th>Dish Soap Prices</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Brand</strong></td>
</tr>
<tr>
<td>Lots of Suds</td>
</tr>
<tr>
<td>Bright Wash</td>
</tr>
<tr>
<td>Spotless Soap</td>
</tr>
<tr>
<td>Lemon Bright</td>
</tr>
</tbody>
</table>

Which brand costs the least per ounce? $12\frac{1}{4}$¢ per oz, $10\frac{3}{4}$¢ per oz, $\approx 10\frac{1}{2}$¢ per oz and $\approx 10.78$¢ per oz.

Spotless Soap is the least expensive.

Which brand gives you the most ounces for one dollar?

Spotless Soap gives you the most ounces for a dollar.

11. Paola is making pillows for her Life Skills class. She bought $2\frac{1}{2}$ yards of green fabric and $1\frac{1}{4}$ yards of purple fabric. Her total cost was $15 for the green fabric and $8.50 for the purple fabric. Which color fabric is cheaper? Justify your answer. Green: $6$ per yard, purple: $6.80$ per yard.

The green fabric is cheaper.

12. The Jimenez family took a four-day road trip. They traveled 300 miles in 5 hours on Sunday, 200 miles in 3 hours on Monday, 150 miles in 2.5 hours on Tuesday, and 250 miles in 6 hours on Wednesday. On which day did they average the greatest speed (miles per hour)?
4.1j Self-Assessment: Section 4.1

Consider the following skills/concepts. Rate your comfort level with each skill/concept by checking the box that best describes your progress in mastering each skill/concept. Corresponding sample problems, referenced in brackets, can be found on the following page.

<table>
<thead>
<tr>
<th>Skill/Concept</th>
<th>Beginning Understanding</th>
<th>Developing Skill and Understanding</th>
<th>Practical Skill and Understanding</th>
<th>Deep Understanding, Skill Mastery</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Compute unit rate from a context.</td>
<td>I struggle to understand how to compute a unit rate from a context.</td>
<td>I can compute a unit rate from a context that uses whole numbers.</td>
<td>I can compute a unit rate from a context that uses whole numbers and decimals.</td>
<td>I can compute a unit rate from a context that uses rational numbers in any form.</td>
</tr>
<tr>
<td>2. Compute a unit rate from a table of values.</td>
<td>I struggle to understand how to compute a unit rate from a table of values.</td>
<td>I can compute a unit rate from a table of values that uses whole numbers and/or fractions as long as the values aren’t out of order.</td>
<td>I can compute a unit rate from a table of values that uses whole numbers and decimals regardless of the order of the values in the table.</td>
<td>I can compute a unit rate from a table of values that uses rational numbers in any form and values are in any order. Further, I can explain what the rate means for the context.</td>
</tr>
<tr>
<td>3. Compare two rates to determine equivalence or to contrast differences.</td>
<td>I can find rates, but I struggle to know how they compare.</td>
<td>I can find rates to determine equivalence or to determine which is greater.</td>
<td>I can change rates to a form that allows me to compare the two to determine equivalence or to determine which is greater. I can also use the different rates to make predications.</td>
<td>I can change rates to a form that allows me to compare the two to determine equivalence or to contrast differences. I can express in my own words similarities and differences between the two and use the information to draw conclusions.</td>
</tr>
<tr>
<td>4. Find the unit rate for BOTH units (i.e. miles per hour and hours per mile).</td>
<td>I struggle to understand how to compute a unit rate.</td>
<td>I can find the unit rate for one unit but often not the other.</td>
<td>I can always find a unit rate for BOTH units.</td>
<td>I can find a unit rate for BOTH units. I can determine which unit rate would be more helpful in a given situation.</td>
</tr>
<tr>
<td>5. Use unit rate to find a missing quantity.</td>
<td>I struggle to know how to use unit rate to find a missing quantity.</td>
<td>I can use unit rate to find a missing quantity involving whole numbers.</td>
<td>I can use unit rate to find a missing quantity involving whole numbers and decimals.</td>
<td>I can use unit rate to find a missing quantity involving whole numbers, decimals, and fractions and I can explain the process I used.</td>
</tr>
</tbody>
</table>
Sample Problems for Section 4.1

1. Given the following situations, find the indicated unit rate for each:
   a. Corrin has twin boys. She buys a box of 10 toy cars to share evenly between the boys.
      ____________ cars per boy
   b. Belle works at a donut shop. They sell a box of donut holes for $1.80. There are 20 donut holes in the box.
      ____________ cost per donut hole
   c. Abby runs \(14 \frac{1}{4}\) laps in \(42 \frac{3}{4}\) minutes.
      _______________ minutes per lap

2. Given the following tables, find the indicated unit rate for each:
   a. _______________ push-ups per day
      | Days | Total Push-ups |
      |------|----------------|
      | 2    | 30             |
      | 4    | 60             |
      | 29   | 435            |
      | 58   | 870            |
   b. _______________ gallons per minute
      | Minutes | Gallons of Water in Swimming Pool |
      |---------|---------------------------------|
      | 2       | 12.4                            |
      | 3       | 18.6                            |
      | 17      | 105.4                           |
      | 27      | 167.4                           |
   c. _______________ hours per kilometer
      | Kilometers | Hours |
      |-------------|-------|
      | 5           | \(\frac{1}{3}\)         |
      | 15          | 1     |
      | 7.5         | \(\frac{1}{2}\)         |
      | \(\frac{1}{4}\) | \(\frac{1}{60}\)     |
3. The following situations each describe two rates. Compare and contrast the two rates. State equivalence or contrast the differences in context of the situation.
   a. In a two minute typing test, Stacey types 100 words. In a five minute typing test, Sarah types 250 words.

   b. A 20 oz. bottle of ketchup is 99¢. A 38 oz. bottle of ketchup is $1.99.

4. For each of the following situations, find the unit rate for BOTH units.
   a. Ivonne drove 357 miles on 10 gallons of gasoline.

   b. In the World Cup, Chile scored 8 goals in 4 games.

5. For each of the following situations, use the unit rate to answer the question.
   a. Katherine is visiting patients in a hospital. She visits 12 patients in 6 hours. At the same rate, how many patients will she visit in 9 hours?

   b. If 4 gallons of gas cost $14.60, how much does 10 gallons of gas cost?

   c. Joaquin runs \(2 \frac{1}{2}\) kilometers in \(\frac{1}{6}\) hours. If he continues running at the same pace, how long will it take him to run 11 kilometers?
Section 4.2: Identify and Communicate Unit Rates in Tables and Graphs.

Section Overview:

In this section, students will connect the concept of proportionality to unit rates, tables, and graphs. Students will first use unit rates to check for proportionality. They will then move into graphs and tables to determine whether paired quantities are proportional. They will learn that proportional quantities always make a straight line emanating from the origin when graphed and that tables showing proportional quantities will give a constant unit rate upon division of every pair of quantities. They will begin to write equations to find missing quantities, using the unit rate as the constant of proportionality, but equations will be further developed in section 4.3. They will also continue to explore the relationship between part:part and part:whole relationships (4.2b) with ideas solidifying in section 4.4.

Key Ratio and Proportion Concepts from Utah Core Standards

RP Standard 1:
1. Extend the concept of a unit rate to include ratios of fractions.
2. Compute a unit rate, involving quantities measured in like or different units.

RP Standard 2:
3. Determine if two quantities expressed in a table or in a graph are in a proportional relationship.
4. Determine a unit rate from a table, graph, equation, diagram or verbal description and relate it to the constant of proportionality.
5. Write an equation for a proportional relationship in the form \( y = kx \).
6. Explain the meaning of the point \((x, y)\) in the context of a proportional relationship.
7. Explain the significance of \((0,0)\) and \((1,r)\) in a graph of a proportional relationship, where \(r\) is the unit rate.

RP Standard 3:
8. Solve multistep problems involving percent using proportional reasoning
9. Find the percent of a number and extend the concept to solving real life percent applications.
10. Calculate percent, percent increase, decrease, and error.

Primary Concepts and Skills to be Mastered in This Section

1. Determine if two rates written as ratios are proportional.
2. Graph a relationship from a table of values.
3. Determine if a relationship is proportional from a graph.
4. Find a unit rate from a table.
5. Find a unit rate from a graph.
6. Explain the significance of \((1, r)\) in a proportional relationship.
7. Compare rates from tables.
4.2a Classroom Activity: Determine Proportionality (Review)

Ratios are considered proportional when the ratios are equivalent. You can use bar models to help you determine proportionality.

Example: In class A the ratio of students wearing shorts to students wearing pants is 1 to 3. In class B, the ratio is proportional.

Draw a model of each situation and use bar models to find the simplified ratios.

Class A:

Class B:

Notice how each ratio could be depicted using the same number of boxes for shorts and for pants for each class with the same number of items in each box. Since the two ratios are equivalent, we can say they are proportional.

1. Draw bar models to determine if the two ratios are proportional.
   a. In one box of cookies, the ratio of chocolate chip cookies to oatmeal cookies is 3 to 8. A bigger box of cookies has a ratio of 12 to 32 chocolate chip cookies to oatmeal cookies.
      They are proportional.

   b. The ratio of cats to total pets in the first pet store is 3 to 9. In the second pet store the ratio of cats to total pets is 6 to 18.
      They are proportional.

The information in both 1a and 1b has been transfer to the tables below. How do the tables help you determine if the ratios are proportional?

<table>
<thead>
<tr>
<th>Chocolate chip cookies</th>
<th>Oatmeal Cookies</th>
</tr>
</thead>
<tbody>
<tr>
<td>3</td>
<td>8</td>
</tr>
<tr>
<td>12</td>
<td>32</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Cats</th>
<th>Total Pets</th>
</tr>
</thead>
<tbody>
<tr>
<td>3</td>
<td>9</td>
</tr>
<tr>
<td>6</td>
<td>18</td>
</tr>
</tbody>
</table>

Help students see the proportionality horizontally on the table. For example, on the first table for both Chocolate Chip Cookie values we multiply by 8/3 to get the number of Oatmeal Cookies. On the second table we multiply both Cat values by 3 to get the number of total pets.
2. The ratio of pink flowers to purple flowers in a vase is 6:8. Make a table to determine if 8 pink flowers to 10 purple flowers is proportional.

They are NOT proportional. 6x = 8; x = 8/6 or 4/3. 8:10 is proportional to 6:8 IF 8(4/3) = 10 → but this is NOT true. 8(4/3) = 32/3 which does not equal 10. Therefore they are not proportional.

Now reduce the fractions in #1 and #2. What do you observe?

From #1a: \(\frac{3}{8}\) \(\frac{12}{32}\)
From #1b: \(\frac{3}{9}\) \(\frac{6}{18}\)
From #2: \(\frac{6}{8}\) \(\frac{8}{10}\)

Proportional relationships reduce to a common fraction, relationships that are not proportional reduce to different fractions.

3. Identify which of the four tables below is not proportional. For each table that is proportional, find the proportional constant (unit rate).

<table>
<thead>
<tr>
<th></th>
<th>a. (x)</th>
<th>y</th>
</tr>
</thead>
<tbody>
<tr>
<td>3</td>
<td>6</td>
<td></td>
</tr>
<tr>
<td>5</td>
<td>10</td>
<td></td>
</tr>
<tr>
<td>10</td>
<td>20</td>
<td></td>
</tr>
<tr>
<td>12</td>
<td>24</td>
<td></td>
</tr>
<tr>
<td>15</td>
<td>30</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th></th>
<th>b. (x)</th>
<th>y</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>1</td>
<td></td>
</tr>
<tr>
<td>4</td>
<td>2</td>
<td></td>
</tr>
<tr>
<td>6</td>
<td>3</td>
<td></td>
</tr>
<tr>
<td>8</td>
<td>4</td>
<td></td>
</tr>
<tr>
<td>10</td>
<td>5</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th></th>
<th>c. (x)</th>
<th>y</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>2</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>6</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>10</td>
<td></td>
</tr>
<tr>
<td>4</td>
<td>14</td>
<td></td>
</tr>
<tr>
<td>5</td>
<td>18</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th></th>
<th>d. (x)</th>
<th>y</th>
</tr>
</thead>
<tbody>
<tr>
<td>−2</td>
<td>−6</td>
<td></td>
</tr>
<tr>
<td>−0.5</td>
<td>−1.5</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>6</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>9</td>
<td></td>
</tr>
<tr>
<td>4</td>
<td>12</td>
<td></td>
</tr>
</tbody>
</table>

Justify why or why not. Yes, the proportional constant is 2. Multiply each \(x\) value by 2 to get the corresponding \(y\) value.
Justify why or why not. Yes, the proportional constant is \(\frac{1}{2}\). Multiply each \(x\) value by \(\frac{1}{2}\) to get the corresponding \(y\) value.
Justify why or why not. No, there is not a proportional constant. For the first pair, you multiply 1 by 2 to get 2; but if you multiply \(x\)-value 2 by 2 you will get 4, not 6. There is no proportional constant.
Justify why or why not. Yes, the proportional constant is 3. Multiply each \(x\) value by 3 to get the corresponding \(y\) value.

If the relationship above is proportional, you can write an equation that relates \(y\) to \(x\): \(y = ____\).
If NOT proportional write “NOT” and then explain why not.

\(y \neq 2x\)
\(y \neq \frac{1}{2}x\)
NOT, there is not a proportional constant that relates \(x\) to \(y\).
\(y = 3x\)

*Again, the equations are just an introduction here. Take time to allow students to see that one can multiply the input (\(x\)) by the proportional constant (unit rate) to get the corresponding output (\(y\)). This is an important central idea.
4. Determine if each set of ratios below is proportional by reducing them to simplest form.
   Note: ratios can be expressed in multiple ways (part:part, part:whole, etc.).

<p>| | | | | |</p>

Challenge: Can you think of other ways to determine proportionality? See student responses. Some students may divide the two numbers and compare their decimals.

Spiral Review

1. Use a model to solve:
   a. $-14 = 3x - 2 \quad x = -4$
   b. $-8 = -3m + 10 \quad m = 6$

2. Evaluate $-2(x + 1) - x$ for $x = -3 \quad 11$

3. Write $\frac{17}{20}$ as a percent and decimal (without a calculator.) $85\%, \ 0.85$

5. Malory got an 75% on her math test. To earn that score, she got 27 questions correct. How many questions were on the test? 36
4.2a Homework: Determine Proportionality (Review)

1. Are the relationships in the tables proportional? If the relationship is proportional, state the proportional constant. If not proportional, explain why not.

<p>| | |</p>

2. The ratio of pink flowers to purple flowers prepared for a wedding will be 2 to 3.

a. Complete the table for varying amounts of pink and purple flowers.

<table>
<thead>
<tr>
<th></th>
<th>2</th>
<th>8</th>
<th>10</th>
<th>20</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pink Flowers</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Purple Flowers</td>
<td></td>
<td>15</td>
<td>45</td>
<td></td>
</tr>
</tbody>
</table>

b. Explain how you can see the proportional relationship in the table. The ratio of pink flower to purple flowers for each ordered pair is 2:3. You may want to point out:

<table>
<thead>
<tr>
<th>“step”</th>
<th>1</th>
<th>4</th>
<th>5</th>
<th>10</th>
<th>15</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pink Flowers</td>
<td>1(2) =2</td>
<td>4(2) =8</td>
<td>5(2) =10</td>
<td>10(2) =20</td>
<td>15(2) =30</td>
</tr>
<tr>
<td>Purple Flowers</td>
<td>1(3) =3</td>
<td>4(3) =12</td>
<td>5(3) =15</td>
<td>10(3) =30</td>
<td>15(3) =45</td>
</tr>
</tbody>
</table>

Purple flowers = (3/2) pink flowers \ OR \ pink flowers = (2/3) purple flowers
4.2b Classroom Activity: Mixing Lemonade—Expressing Proportionality

Review: Recall the sunflower and rose example from 4.1a. There the ratio of sunflowers to roses was 1:3. We also noted that 25% of the flowers in the example were sunflowers because 1 in 4 of the parts were sunflowers.

You want to sell lemonade by the park. Different brands of lemonade have different formulas. You want to sell the lemonade that tastes the most “lemony.”

a. Use a model to show the portion of mixture that is lemon concentrate and water.
b. What fraction of the mix is concentrate? What fraction is water?
c. What percent of the mix is concentrate? What percent is water?
d. Create a unit rate \( \frac{\text{water}}{\text{concentrate}} \) for each mixture.
e. Answer the question.

1. 2 cups concentrate, 3 cups water
   a. \( \frac{1}{4} \text{ c con} \quad \frac{1}{4} \text{ c con} \quad \frac{1}{4} \text{ c water} \quad \frac{1}{4} \text{ c water} \quad \frac{1}{4} \text{ c water} \)
   or
   \( \frac{1}{4} \text{ c conc} \quad \frac{1}{4} \text{ c conc} \quad \frac{1}{4} \text{ c water} \quad \frac{1}{4} \text{ c water} \quad \frac{1}{4} \text{ c water} \)
   b. \( w = \frac{3}{5}, c = \frac{2}{5} \)
   c. \( w = 60\%, c = 40\% \)
   d. \( 3/2 \text{ cups of water to 1 cup concentrate} \)
   e. If you have 12 cups of concentrate, how much water will you need? 18 cups of water because the ratio of concentrate to water is 1 to 3/2

2. 4 cups water mixes with 1 cup concentrate
   a. \( \frac{1}{8} \text{ c con} \)
   \( \frac{1}{8} \text{ c water} \quad \frac{1}{8} \text{ c water} \quad \frac{1}{8} \text{ c water} \quad \frac{1}{8} \text{ c water} \)
   Either model (part-part-whole or comparison) will work here. Only one is shown.
   b. \( w = \frac{4}{5}, c = \frac{1}{5} \)
   c. \( w = 80\%, c = 20\% \)
   d. \( 4 \text{ cups water to 1 cup conc.} \)
   e. If you have 20 cups of concentrate, how much water will you need? \( 80 \text{ c water} \)

3. 4 cups concentrate, 6 cups water
   a. \( \frac{1}{4} \text{ c con} \quad \frac{1}{4} \text{ c con} \quad \frac{1}{4} \text{ c con} \quad \frac{1}{4} \text{ c con} \quad \frac{1}{4} \text{ c water} \quad \frac{1}{4} \text{ c water} \quad \frac{1}{4} \text{ c water} \quad \frac{1}{4} \text{ c water} \quad \frac{1}{4} \text{ c water} \)
   b. \( w = \frac{3}{5}, c = \frac{2}{5} \)
   c. \( w = 60\%, c = 40\% \)
   d. 1.5 cups water to 1 cup conc.
   e. How much concentrate do you need if you’re going to use 18 cups of water? \( 12 \text{ c concentrate} \)

4. 3 cups concentrate, 5 cups water
   a. \( \frac{1}{4} \text{ c con} \quad \frac{1}{4} \text{ c con} \quad \frac{1}{4} \text{ c con} \quad \frac{1}{4} \text{ c con} \quad \frac{1}{4} \text{ c water} \quad \frac{1}{4} \text{ c water} \quad \frac{1}{4} \text{ c water} \quad \frac{1}{4} \text{ c water} \quad \frac{1}{4} \text{ c water} \)
   b. \( w = \frac{5}{8}, c = \frac{3}{8} \)
   c. \( w = 62.5\%, c = 37.5\% \)
   d. \( 1\frac{1}{2} \text{ cups water to 1 cup conc.} \)
   e. How much concentrate do you need if you’re going to use 18 cups of water? \( 10.8 \text{ c concentrate} \)
5.  \( \frac{1}{2} \) cup concentrate, 2 cups water
   a. 8 cups water for 4 cups of concentrate
   b. \( w = \frac{4}{5}, \ c = \frac{1}{5} \)
   c. \( w = 80\%, \ c = 20\% \)
   d. 4 cups water to 1 cup conc.
   e. How much concentrate do you need if you’re going to use 10 water? 2.5 c concentrate.

6. 8 cups water for 4 cups of concentrate
   a. Either model will work. See student work.
   b. \( w = \frac{3}{5}, \ c = \frac{2}{5} \)
   c. \( w \approx 67\%, \ c \approx 33\% \)
   d. 2 cups water to 1 cup conc.
   e. How much water do you need if you’re going to use 16 water? 8 c concentrate.

7. 1 cup water for every \( \frac{2}{3} \) cup concentrate
   a. Either model will work. See student work.
   b. \( w = \frac{3}{5}, \ c = \frac{2}{5} \)
   c. \( w = 60\%, \ c = 40\% \)
   d. 1.5 cups w to 1 cup c
   e. How much water do you need if you’re going to use 9 cups of concentrate? 13.5 c water.

8. \( \frac{1}{2} \) cup concentrate, 1 cup water
   a. Either model will work. See student work.
   b. \( w = \frac{3}{5}, \ c = \frac{2}{5} \)
   c. \( w \approx 67\%, \ c \approx 33\% \)
   d. 2 cups w to 1 cup c
   e. How much water do you need if you’re going to use 7 cups of concentrate? 14 c water

9. Are any of the mixes (#1-8) proportional to others in the set? In other words, do any sets have the same unit rates? Explain how you know. Yes. 6 and 8; 1, 3 and 7; 2 and 5. Possible answers include: their bars (a), their fractions (b), their percents (c) or their unit rates (d) are the same.

10. For the mixes that are proportional, how does the unit rate relate to the fraction or percent?
    The ratio between the fractions (or percents) simplifies to the unit rate.

11. Which mix will make the strongest lemonade (most lemon flavor)? The weakest? Explain how you know.
    Strongest: mix #1, 3 and 7 – they have the lowest fraction or % of water. (or highest of concentrate)
    Weakest: mix #2 and 5 – they have the highest fraction or % of water. (or lowest of concentrate)

12. Order the lemonade from weakest to strongest lemonade flavor. Explain your order.
    (2 and 5); (6 and 8); 4; (1, 3, and 7)
Spiral Review

1. Order the following fractions from least to greatest

\[
\frac{9}{10}, \quad \frac{3}{7}, \quad \frac{3}{4}, \quad \frac{6}{5}, \quad \frac{4}{3}, \quad \frac{4}{5}, \quad \frac{6}{10}, \quad \frac{9}{4}, \quad \frac{3}{7}
\]

2. I go to a department store with a coupon for 20% off any one item. The shoes that I want are on sale for 40% off. What was the original price if I paid $48? $100

3. Use the distributive property to rewrite the following expression \(-4(5x - 1)\)\quad -20x + 4

4. Find each sum without a model.
   a. \(-27.2 + \frac{4}{5}\)
   b. \(98.1 + (-1.35)\) 97
4.2b Homework: Expressing Proportionality

**Winner Lollipops**
Winner Candy Company has had three different promotions for selling more lollipops. Each promotion involves randomly wrapping coupons in lollipops for free lollipops. You are the new president of the company and your job is to find the best strategy for this promotion for your company. In other words, you want to find the strategy that gives the least number of free lollipops.

<table>
<thead>
<tr>
<th>a. 2 coupons per 10 lollipop wrappers</th>
<th>b. 3 coupons per 9 lollipop wrappers</th>
<th>c. 4 coupons per 15 lollipop wrappers</th>
</tr>
</thead>
</table>

Explain the reasoning using unit rates, models, percentages, and explanations

Which would be better for the customer (more chance of a free lollipop)?

**Mixing Smoothies**
Use any method you want to solve the “smoothie” proportion question below.

<table>
<thead>
<tr>
<th>Smoothie recipes</th>
</tr>
</thead>
<tbody>
<tr>
<td>a. ¼ cup bananas (mashed)</td>
</tr>
<tr>
<td>½ cup Greek Yogurt</td>
</tr>
<tr>
<td>2/3 cup strawberries (mashed)</td>
</tr>
<tr>
<td>b. 2 cup bananas (mashed)</td>
</tr>
<tr>
<td>1.5 cup Greek yogurt</td>
</tr>
<tr>
<td>3 cup strawberries (mashed)</td>
</tr>
<tr>
<td>c. 1 cup bananas (mashed)</td>
</tr>
<tr>
<td>1 cup Greek yogurt</td>
</tr>
<tr>
<td>1 cup strawberries (mashed)</td>
</tr>
</tbody>
</table>

If all the smoothies are served in 12 oz. portions, which would have the most…

1. Banana
2. Strawberry
3. Greek yogurt

Explain your answer using unit rates, models, percentages, etc.:
4.2c Classwork: Proportions from Tables and Graphs

We have seen tabular and model representations to show proportional thinking--a graph is another representation of paired numbers and is a way to show or check for a proportional relationship.

1. The following table shows the relationship between the amount of cherries (in pounds) and cost.

<table>
<thead>
<tr>
<th>Cost ($)</th>
<th>1.50</th>
<th>3.00</th>
<th>4.50</th>
<th>6.00</th>
<th>7.50</th>
</tr>
</thead>
<tbody>
<tr>
<td>Amount (lbs.)</td>
<td>1</td>
<td>2</td>
<td>3</td>
<td>4</td>
<td>5</td>
</tr>
</tbody>
</table>

- a. Is this a proportional relationship? How do you know?
  Yes, they ALL reduce to the same unit rate of $1.50 per pound.
- b. Put the information from the table on the graph below, with amount of cherries on the x axis and cost on the y axis (put these labels on the graph).

**As the students look at the graphs, ask them where they see the unit rate in the table.**

2. The following table shows the relationship between the number of ounces in soup cans and cost.

<table>
<thead>
<tr>
<th>Cost ($)</th>
<th>1.00</th>
<th>1.50</th>
<th>2.00</th>
<th>2.50</th>
<th>3.00</th>
</tr>
</thead>
<tbody>
<tr>
<td>Amount (oz)</td>
<td>8</td>
<td>16</td>
<td>24</td>
<td>30</td>
<td>36</td>
</tr>
</tbody>
</table>

- a. Is this a proportional relationship? How do you know?
  No, they do not ALL reduce to the same unit rate.
- b. Graph the information in the table, using and labeling the x-axis for amount (oz) and y-axis for the cost.

**Emphasize labeling the graph.** This is the first time in this course that students are asked to graph points on a Cartesian plane. You may need to have a warm-up or an information assessment to see whether they remember how to graph points. You could also review the ordered pair representation of points, and that the first number always tells you have far left or right from the origin, and the second number tells how far up or down from the origin.

**The terms “unit rate” and “proportional constant” will be used interchangeably as they relate to the same numeric value. Help students understand that they represent the same quantity.**
3. The following table shows the pounds of meat on a sandwich and the calories in the sandwich.

<table>
<thead>
<tr>
<th>Calories</th>
<th>560</th>
<th>650</th>
<th>740</th>
<th>830</th>
<th>920</th>
</tr>
</thead>
<tbody>
<tr>
<td>Meat (lbs)</td>
<td>0.5</td>
<td>1</td>
<td>1.5</td>
<td>2</td>
<td>2.5</td>
</tr>
</tbody>
</table>

a. Is this a proportional relationship? How do you know?
   No, because they do not reduce to the same unit rate.

b. Graph the information from the table. Label the axes, using meat (lbs) on the x-axis.

![Graph of meat (lbs) vs. calories](image)

Do you have a conjecture about how to determine if a table of values represents a proportional relationship? IF ALL the (nonzero) ratios between output and input (or input and output) reduce to the same unit rate, the relationship represented is proportional.

Do you have a conjecture about how to determine if a graph of values represents a proportional relationship? Proportional relationships need to be straight lines that go through the origin (0,0).

4. For the two scenarios below, complete the table and determine if it shows a proportional relationship. If it is proportional, state the proportional constant.

a. A flower that is 3 inches tall when planted grows $\frac{1}{2}$ an inch every 4 weeks.

<table>
<thead>
<tr>
<th>Weeks</th>
<th>0</th>
<th>4</th>
<th>8</th>
<th>12</th>
<th>16</th>
</tr>
</thead>
<tbody>
<tr>
<td>Height (inches)</td>
<td>3</td>
<td>$\frac{3}{2}$</td>
<td>4</td>
<td>$\frac{4}{2}$</td>
<td>5</td>
</tr>
</tbody>
</table>

No, there is not a proportional constant.

b. The sum of two numbers is 0 (use $x$ and $y$ to represent the two numbers).

<table>
<thead>
<tr>
<th>$x$</th>
<th>-2</th>
<th>-1</th>
<th>0</th>
<th>1</th>
<th>2</th>
</tr>
</thead>
<tbody>
<tr>
<td>$y$</td>
<td>2</td>
<td>1</td>
<td>0</td>
<td>-1</td>
<td>-2</td>
</tr>
</tbody>
</table>

Yes, the constant of proportionality is $-1$. 
5. Peter is renting wave runners for a company party. Each wave runner holds 3 people.

a. Complete the table below to show the relationship between the number of wave runners rented and the number of people that can ride.

<table>
<thead>
<tr>
<th># of Wave Runners</th>
<th># of Riders</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>1</td>
<td>3</td>
</tr>
<tr>
<td>2</td>
<td>6</td>
</tr>
<tr>
<td>3</td>
<td>9</td>
</tr>
<tr>
<td>5</td>
<td>15</td>
</tr>
<tr>
<td>8</td>
<td>24</td>
</tr>
</tbody>
</table>

b. Graph the relationship number of wave runners to the number of riders with wave runners on the x-axis and number of riders on the y-axis.

![Graph of wave runners vs riders]

5. Peter is renting wave runners for a company party. Each wave runner holds 3 people.

a. Complete the table below to show the relationship between the number of wave runners rented and the number of people that can ride.

<table>
<thead>
<tr>
<th># of Wave Runners</th>
<th># of Riders</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>1</td>
<td>3</td>
</tr>
<tr>
<td>2</td>
<td>6</td>
</tr>
<tr>
<td>3</td>
<td>9</td>
</tr>
<tr>
<td>5</td>
<td>15</td>
</tr>
<tr>
<td>8</td>
<td>24</td>
</tr>
</tbody>
</table>

b. Graph the relationship number of wave runners to the number of riders with wave runners on the x-axis and number of riders on the y-axis.

![Graph of wave runners vs riders]

c. Find the ratio of riders to number of wave runners for several different ordered pairs in the table.

\[
\text{number of riders} : \text{number of wave runners} = \frac{15}{5} : \frac{6}{2} : \frac{3}{1}
\]

Ask students if they can see the ratio in the table and graph. Point out that the graph goes through the origin.

d. Where do you see the unit rate in the table? When input (# of wave runners) = 1, output = 3.

**Point out that the location (1, 3) illustrates the unit rate because we have 1 for the input.**

e. What is the significance of the point (0, 0)? If he doesn’t rent any wave runners, no one can ride.

f. What is the relationship between the number of riders, \( r \), and the number of wave runners, \( w \)? You can multiply the number of wave runners by 3 to figure out how many riders you can accommodate.

You might ask how many wave runners you’d need if there were going to be 50 people.

g. Use the relationship and graph to determine how many wave runners Peter needs to rent if there will be 39 people at his company party that all want to ride a wave runner.

Peter will need to rent 13 wave runners if 39 people want to ride at his party.

h. Write an equation expressing the number of riders, \( r \), in terms of the number of wave runners, \( w \).

Where do you see the unit rate (proportional constant) in this equation?

\[ r = 3w \]

The unit rate (proportional constant) is the coefficient of the variable \( w \).
6. Bubba’s Body Shop charges $25 per hour to fix a car.
Complete the table and graph to represent this situation. Be sure to label the axes of your graph.

<table>
<thead>
<tr>
<th>$t$ (time in hours)</th>
<th>$C$ (cost in dollars)</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>2</td>
<td>50</td>
</tr>
<tr>
<td>3</td>
<td>75</td>
</tr>
<tr>
<td>5</td>
<td>125</td>
</tr>
<tr>
<td>8</td>
<td>200</td>
</tr>
</tbody>
</table>

a. What is the cost for Bubba to spend 1 hour to fix your car? $25
b. What is the significance of the number found in part a.? It is the unit rate = proportional constant.
c. Write an equation to show the relationship between the cost $C$ Bubba charges to fix a car for $t$ hours?
   $$C = 25t$$
d. Are cost and time proportionally related in this situation? Justify your answer using information from your table, graph, and equation.
   Yes, in the table a constant ratio can be found, it is 25. The graph is a straight line going through the origin and the equation relates time to cost by multiplying the number of hours by 25.
   **Make sure students see that point (1, 25) is significant because it represents the unit rate of a proportional relationship.**

7. Sunset Splash and Spa charges an entrance fee of $5.00 and then $2.00 per hour.
a. Complete the table and graph to represent this situation. Be sure to label the axes of your graph.

<table>
<thead>
<tr>
<th>$t$ (time in hours)</th>
<th>$C$ (cost in dollars)</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>5</td>
</tr>
<tr>
<td>1</td>
<td>7</td>
</tr>
<tr>
<td>2</td>
<td>9</td>
</tr>
<tr>
<td>3</td>
<td>11</td>
</tr>
<tr>
<td>4</td>
<td>13</td>
</tr>
<tr>
<td>5</td>
<td>15</td>
</tr>
</tbody>
</table>

b. Are cost and time proportionally related in this situation? Justify your answer using information from your table, graph, and equation.
   No, there is not a constant ratio in the table and the line on the graph does not go through the origin. The equation does not relate hours to cost only through multiplication, there is addition as well.
   *Extension: you may ask students if they can determine the equation of this relationship. $C = \text{start} + \text{unit rate} \cdot \text{time} \Rightarrow C = 5 + 2t$
1. Zach invested $1500. If he earned 23.2% on his investment, a) write an expression for the amount of money he now has and b) state how much money he now has.
   a) $1.232(1500)   b) $1848

2. Lara has $1,425 in her bank account. How much money did she start with if that amount reflects a 14% increase on her original amount? $1,250

3. There are 36 red and 44 blue marbles in a bag. What is the probability of randomly drawing a red marble? $\frac{36}{80}$ or $\frac{9}{20}$

4. Express each percent as a fraction in simplest form.

\[
\begin{align*}
44\% & \quad \frac{44}{100} = \frac{11}{25} \\
17.5\% & \quad \frac{175}{1000} = \frac{7}{40}
\end{align*}
\]
4.2c Homework: Proportions (Unit Rates) from Tables and Graphs

Label the axes and graph the information from the table. Use the table to determine if the relationship represented is proportional throughout the table. If it is proportional, state the proportional constant (unit rate) as a fraction or as a decimal. If it is not proportional, write N/A (Not Applicable) for unit rate questions.

1. Bananas (lbs) | 0 | 1 | 2 | 3 | 4 | 5 | 6
---|---|---|---|---|---|---|---
Price ($)| 0 | 0.40 | 0.80 | 1.20 | 1.60 | 2.00 | 2.40

Proportional? Yes or No? Explain your answer.

If yes, what is the unit rate? (pick the most useful unit rate)

If proportional, where do you see the unit rate in the table and in the graph?

2. Bagels | 1 | 2 | 6 | 13 | 19 | 26
---|---|---|---|---|---|---
Price ($)| 0.75 | 1.50 | 4.50 | 9.00 | 13.50 | 18.00

Proportional? Yes or No? Explain your answer.

If yes, what is the unit rate? (pick the most useful unit rate)

If proportional, where do you see the unit rate in the table and in the graph?
3. Eggs

<table>
<thead>
<tr>
<th></th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cups of milk</td>
<td>$\frac{1}{2}$</td>
<td>1</td>
<td>$\frac{13}{10}$</td>
<td>$\frac{9}{5}$</td>
<td>2</td>
<td>3</td>
</tr>
</tbody>
</table>

Proportional? Yes or No? Explain your answer.

If yes, what is the unit rate? (pick the most useful unit rate)

If proportional, where do you see the unit rate in the table and in the graph?

4. # of MP3s

<table>
<thead>
<tr>
<th></th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
<th>10</th>
</tr>
</thead>
<tbody>
<tr>
<td>Price ($)</td>
<td>1.00</td>
<td>1.50</td>
<td>1.75</td>
<td>1.90</td>
<td>2.00</td>
<td>5.00</td>
</tr>
</tbody>
</table>

Proportional? Yes or No? Explain your answer.

If yes, what is the unit rate? (pick the most useful unit rate)

If proportional, where do you see the unit rate in the table and in the graph?

5. Minutes

<table>
<thead>
<tr>
<th></th>
<th>0</th>
<th>500</th>
<th>1000</th>
<th>1500</th>
<th>2000</th>
<th>2500</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cell Phone Monthly Charge</td>
<td>$10</td>
<td>$20</td>
<td>$30</td>
<td>$40</td>
<td>$50</td>
<td>$60</td>
</tr>
</tbody>
</table>

Proportional? Yes or No? Explain your answer.

No. Is not a straight line through (0, 0).

If yes, what is the unit rate? (pick the most useful unit rate)

N/A

If proportional, where do you see the unit rate in the table and in the graph? N/A
Determine whether or not each graph represents a proportional relationship.

6. Proportional? Yes or No
   If proportional, find the unit rate.

7. Proportional? Yes or No
   If proportional, find the unit rate.

8. Proportional? Yes or No
   Yes
   If proportional, find the unit rate. 6/16 = 3/8

9. Proportional? Yes or No
   If proportional, find the unit rate.

10. Proportional? Yes or No
    If proportional, find the unit rate.

11. Which graphs above show proportional relationships? How do you know?
4.2d Classwork: Review Proportional Tables, Stories, and Graphs and Compare Rates

1. For the table below, a) create a context, b) graph the data, making sure to label your axes, c) determine if the relationship is proportional, and c) state the relationship between gallons bought and money spent:

<table>
<thead>
<tr>
<th>Gallons bought</th>
<th>Money spent on gas</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>$3.75</td>
</tr>
<tr>
<td>2</td>
<td>$7.50</td>
</tr>
<tr>
<td>3</td>
<td>$11.25</td>
</tr>
<tr>
<td>4</td>
<td>$15</td>
</tr>
<tr>
<td>5</td>
<td>$18.75</td>
</tr>
<tr>
<td>10</td>
<td>$37.50</td>
</tr>
<tr>
<td>20</td>
<td>$75</td>
</tr>
<tr>
<td>100</td>
<td>$375</td>
</tr>
</tbody>
</table>

Money spent = 3.75 \times \text{gallons purchased}

2. Toni ran in a marathon. The graph given below represents the distance she has traveled since the beginning of the race.

a. Create a table with at least three entries showing her distance at different times.

<table>
<thead>
<tr>
<th>hours</th>
<th>miles run</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>6</td>
</tr>
<tr>
<td>2</td>
<td>12</td>
</tr>
<tr>
<td>3</td>
<td>18</td>
</tr>
</tbody>
</table>

b. Is the relationship between time and distance proportional? Explain.
   Yes, the unit rate/proportional constant is 6. Is line through origin. Miles run = (6 miles/hr) \times \text{hours}.

c. If proportional, where do you see the unit rate in the table and on the graph?
   Is proportional so in table 1 hour corresponds to 6 miles. On the graph, it is the point (1, 6)

d. Suppose another runner started at the same time as Toni and in 3.5 hours ran a distance of 20 miles. Which runner was going faster? Toni, her unit rate is 6 while the other run’s is 20/3.5 (≈ 5.714).
3. Examine the graphs below: a) fill in a table with at least two values and then b) determine if the graphs show a proportional relationship. If the graph is a proportional relationship state the proportional constant.

<p>| | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>x</td>
<td>y</td>
</tr>
<tr>
<td></td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td></td>
<td>2</td>
<td>4</td>
</tr>
</tbody>
</table>

Proportional? (Yes or No) Yes
Proportional constant: 2

<table>
<thead>
<tr>
<th>b</th>
<th>x</th>
<th>y</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td></td>
<td>5</td>
<td>7.5</td>
</tr>
</tbody>
</table>

Proportional? (Yes or No) Yes
Proportional constant: \( \frac{3}{2} \) or 1.5

<table>
<thead>
<tr>
<th>c</th>
<th>x</th>
<th>y</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td></td>
<td>5</td>
<td>5</td>
</tr>
</tbody>
</table>

Proportional? (Yes or No) Yes
Proportional constant: 1

<table>
<thead>
<tr>
<th>d</th>
<th>x</th>
<th>y</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td></td>
<td>5</td>
<td>10</td>
</tr>
</tbody>
</table>

Proportional? (Yes or No) Yes
Proportional constant: 3

Graph each proportional relationship from above on the grid below.

For each x value in the relationship above, state the corresponding y value:

- a) if \( x = 1 \), \( y = \underline{2} \)
- b) if \( x = 1 \), \( y = \underline{1.5} \)
- c) if \( x = 1 \), \( y = \underline{1} \)
- d) if \( x = 1 \), \( y = \underline{3} \)

What do you notice about the relationship between the graphs and the proportional constant? The bigger the proportional constant the steeper the line. The proportional constant and unit rate are the same.
Use the story to complete the following. Milo and Sera each bought chocolate cinnamon bears from different candy stores. Milo paid $3.00 for 2 pounds and Sera paid $5.25 for 3 pounds.

4. Fill in each box for Milo’s purchase:

<table>
<thead>
<tr>
<th>x pounds</th>
<th>y cost</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>1</td>
<td>1.50</td>
</tr>
<tr>
<td>2</td>
<td>3.00</td>
</tr>
<tr>
<td>3</td>
<td>4.50</td>
</tr>
<tr>
<td>4</td>
<td>6.00</td>
</tr>
</tbody>
</table>

b. Sketch a graph. LABEL axes.

c. Is this a proportional relationship? Explain. Yes, unit rate. Graph is straight line through (0, 0).

d. If proportional, what is the unit rate? Highlight the corresponding point on graph.

$1.50 per pound; (1, 1.50)

e. State the relationship between pounds and cost:

\[ y = 1.5x \]

5. Fill in each box for Sera’s purchase:

<table>
<thead>
<tr>
<th>x pounds</th>
<th>y cost</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>1</td>
<td>1.75</td>
</tr>
<tr>
<td>2</td>
<td>3.50</td>
</tr>
<tr>
<td>3</td>
<td>5.25</td>
</tr>
<tr>
<td>4</td>
<td>7.00</td>
</tr>
</tbody>
</table>

b. Sketch a graph. LABEL axes.

c. Is this a proportional relationship? Explain. Yes, unit rate. Graph is straight line through (0, 0).

d. If proportional, what is the unit rate? Highlight the corresponding point on graph.

$1.75 per pound; (1, 1.75)

e. State the relationship between pounds and cost:

\[ y = 1.75x \]

6. Who got the best deal on chocolate cinnamon bears? Explain?

Milo, he paid $1.50 per pound while Sera paid $1.75. Discuss this from a number of perspectives: table, graph and equation. Talk about the information obtained from the unit rate, how it’s related to the proportional constant and how it helps in comparing information.
Spiral Review

1. There are a total of 127 cars and trucks on a lot. If there are four more than twice the number of trucks than cars, how many cars and trucks are on the lot?

2. Use the number line below to show why \((-1)(-1) = 1\)

```
-20 -15 -10  -5  0   5   10   15   20
```

3. If the ratio of girls to boys in a class is 3 to 4 and there are 35 students in the class. How many students are girls? **There are 15 girls in the class (and 20 boys.)**

4. Fill in the equivalent fraction and percent for this decimal:

<table>
<thead>
<tr>
<th>Fraction</th>
<th>Decimal</th>
<th>Percent</th>
</tr>
</thead>
<tbody>
<tr>
<td>(\frac{19}{20})</td>
<td>.95</td>
<td>95%</td>
</tr>
</tbody>
</table>
4.2d Homework: Compare Unit Rates Using Tables and Graphs

1. Mario will pay you 360 gold coins for 2 hours of racing Go-Karts. Luigi will pay you 426 gold coins for 3 hours of racing Go-Karts. Find the best offer using three different methods (table, rate and graph.)

a. Complete the table.

<table>
<thead>
<tr>
<th>Hours</th>
<th>Payment</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>180</td>
</tr>
<tr>
<td>2</td>
<td>360</td>
</tr>
<tr>
<td>3</td>
<td>540</td>
</tr>
<tr>
<td>4</td>
<td>720</td>
</tr>
<tr>
<td>5</td>
<td>900</td>
</tr>
</tbody>
</table>

b. Write each offer as rate fraction.

Mario’s: \( \frac{360}{2} \)

Luigi’s: ____________________________

Find the unit rate for each offer, including labels.

Mario’s: 180 coins per hour

Luigi’s: ____________________________

c. Graph each offer in a different color on the same coordinate plane. Label your axes.

![Graph showing Mario's and Luigi's offers]

d. Which is the best offer? Why? (In your explanation, explain how the table, unit rate and graph help you to see the best offer.)
2. The Jones family drives 200 miles in 5 hours. The Grant family drives 360 miles in 6 hours. Compare the car trips. Assume they both traveled at a constant rate.

a. Complete the table for each family.

<table>
<thead>
<tr>
<th>Jones Family</th>
<th>Grant Family</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hours</td>
<td>Miles</td>
</tr>
<tr>
<td>Hours</td>
<td>Miles</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Unit rate:     Unit rate:     

b. Graph each family’s rate in a different color on the same coordinate plane. Label axes.

c. Compare the driving trips of the two families. In your comparison, explain how the table, unit rate and graph help you to see the difference in the two trips.

3. The tortoise can walk ½ a mile in ¼ of an hour. The hare can run 1½ miles in ½ hour. Compare their speed.

a. Complete the table for each animal.

<table>
<thead>
<tr>
<th>Tortoise</th>
<th>Hare</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hours</td>
<td>Miles</td>
</tr>
<tr>
<td>Hours</td>
<td>Miles</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Unit Rate:     Unit Rate:     

b. Graph each animal’s rate in a different color on the same coordinate plane.

c. Compare the speeds. In your comparison, explain how the table, unit rate and graph help you to see the difference in the two trips.
4.2e Classroom Activity: Jon’s Marathon—Find Unit Rate (Proportional Constant) in Tables and Graphs

Jon is running a marathon. His average speed is 15 miles in 3 hours. Pretend his average speed was constant for the entire marathon. Fill in the table below.

<table>
<thead>
<tr>
<th>Hours</th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>7</th>
<th>10</th>
<th>24</th>
<th>$h$</th>
</tr>
</thead>
<tbody>
<tr>
<td>Miles</td>
<td>0</td>
<td>5</td>
<td>10</td>
<td>15</td>
<td>20</td>
<td>35</td>
<td>50</td>
<td>120</td>
<td>$5h$</td>
</tr>
</tbody>
</table>

1. What is the unit rate (proportional constant) and how does this unit rate help you figure out the number of miles traveled at any given hour? 5 mph. Multiply the number of hours by 5.

2. If $m$ represents the number of miles and $h$ represents the number of hours, state the relationship between $m$ and $h$. miles = 5 times hours; $m = 5h$

3. Use your rule to predict the number of miles that can be run in 2.6 hours and the number of hours it would take to run 55 miles. 2.6 hours = 13 miles. 55 miles = 11 hours

4. Create a graph showing Jon’s progress in the marathon. Label the $x$-axis (horizontal) as “hours” and the $y$-axis (vertical) as “miles.” Think carefully about the scale before you start graphing- you won’t see much information if you make each unit on the graph represent 1 mile.

5. Where does the unit rate show up in the graph? How steep the line is. **The $y$ coordinate when $x = 1$.**

6. Use the graph to find the number of miles run in 12 hours. 60 miles

7. Use the graph to find the number of hours it took to run 30 miles. 6 hours.

8. How does the mathematical rule (from question 3 above) relate to the graph? **See student response**
Spiral Review

1. Luke has 90 baseball cards. He sells $\frac{1}{3}$ of the cards. He stores 20% of the rest in a safety deposit box and the rest in his dresser drawer. How many baseball cards are in his dresser drawer? 48

2. Find the product without a calculator: $15.5(-8) = -124$

3. Suppose you were to roll a fair 6-sided number cube once, then flip a coin. List all the possible outcomes.

   1H, 2H, 3H, 4H, 5H, 6H, 1T, 2T, 3T, 4T, 5T, 6T

4. Using the information in question 3, what is the probability of getting a heads and an even number?
   $\frac{3}{12}$ or $\frac{1}{4}$
4.2e Homework Activity: Revisit Making Lemonade

1. Find the “mix-matches” in the lemonade formulas below (that is the ones with the same proportional constant [or unit rate] ).

<p>| | | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>(\frac{1}{2}) cup concentrate, 1 cup water</td>
<td>2.</td>
<td>(\frac{2}{3}) cup concentrate, 1 cup water</td>
</tr>
<tr>
<td>3.</td>
<td>(\frac{1}{2}) cup, 2 cups water</td>
<td>4.</td>
<td>2 cups concentrate, 3 cups water</td>
</tr>
<tr>
<td>5.</td>
<td>1 cup concentrate, 4 cups water</td>
<td>6.</td>
<td>4 cups concentrate, 8 cups water</td>
</tr>
<tr>
<td>7.</td>
<td>4 cups concentrate, 6 cups water</td>
<td>8.</td>
<td>3 cups concentrate, 5 cups water</td>
</tr>
</tbody>
</table>

2. Fill in the information for the “mix-matches” in the tables below.
   a. Record the “mix-matches” in the top of the table (from least “lemony” to most “lemony”).
   b. Complete a table for each “mix-match” (use numbers from the chart).
   c. Circle the data in each table which shows the unit rate for water to concentrate.
   d. Write the unit rate (of water to concentrate) as a fraction with labels.
   e. State the proportional relationship between concentrate and water.

<table>
<thead>
<tr>
<th>Least Lemony</th>
<th></th>
<th></th>
<th>Most Lemony</th>
</tr>
</thead>
<tbody>
<tr>
<td>A. Mixes</td>
<td></td>
<td></td>
<td>D. Mixes</td>
</tr>
<tr>
<td>Conc. (x)</td>
<td>Water (y)</td>
<td>Conc. (x)</td>
<td>Water (y)</td>
</tr>
<tr>
<td>1</td>
<td>4</td>
<td>5</td>
<td>20</td>
</tr>
<tr>
<td>2</td>
<td>8</td>
<td>6</td>
<td>24</td>
</tr>
<tr>
<td>3</td>
<td>12</td>
<td>4 cups water/cup concentrate</td>
<td></td>
</tr>
</tbody>
</table>

3. Predict what you think the graphs will show about lemonade mixes A, B, C and D.
4. Graph the data from the tables for Mixes A, B, C, and D. Use the same scale on each graph.

5. Were your predictions about the graphs correct? What do the graphs show?
   a. How do they show the proportional constant or unit rate?
      The unit rate shows up where \( x = 1 \).
   b. How do they show “lemony-ness?”
      The lemony-ness shows up in the steepness of the graph. In this case, the steeper the line, the less lemony.

6. Compare the lemonade tables of data, the equations and the graphs.
   a. What do they have in common?

   b. Which do you like best to tell the story of lemonade mixes? Why?
4.2f Review: Representing a Proportional Relationship with a Table, Graph, and Equation

Follow these steps for each situation given below.

a. Create a table
b. Determine the unit rate (proportional constant)
c. Create a graph (use the “unit” label across the bottom of the graph).
d. Write a simple mathematical formula for the situation.

1. Rhonda was paid $24 for 4 hours of babysitting.

<table>
<thead>
<tr>
<th>Hours (x)</th>
<th>Pay (y)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>6</td>
</tr>
<tr>
<td>2</td>
<td>12</td>
</tr>
<tr>
<td>3</td>
<td>18</td>
</tr>
<tr>
<td>4</td>
<td>24</td>
</tr>
<tr>
<td>5</td>
<td>30</td>
</tr>
</tbody>
</table>

![Graph for Rhonda's babysitting earnings]

Unit Rate = $6.00 per hour

\[ y = 6x \]

2. Carlos made 6 goals in 3 soccer games. (assume this is his regular habit)

<table>
<thead>
<tr>
<th>Games (x)</th>
<th>Goals (y)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>2</td>
</tr>
<tr>
<td>2</td>
<td>4</td>
</tr>
<tr>
<td>3</td>
<td>6</td>
</tr>
<tr>
<td>4</td>
<td>8</td>
</tr>
<tr>
<td>5</td>
<td>10</td>
</tr>
</tbody>
</table>

![Graph for Carlos's soccer goals]

Unit Rate = 2 goals per game

\[ y = 2x \]

3. Itzel drove 30 miles in a half hour.

<table>
<thead>
<tr>
<th>Hours (x)</th>
<th>Miles (y)</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.5</td>
<td>30</td>
</tr>
<tr>
<td>1</td>
<td>60</td>
</tr>
<tr>
<td>2</td>
<td>120</td>
</tr>
<tr>
<td>3</td>
<td>180</td>
</tr>
<tr>
<td>4</td>
<td>240</td>
</tr>
</tbody>
</table>

![Graph for Itzel's driving distance]

Unit Rate = 60 miles per hour

\[ y = 60x \]
4. Carmen bought 3 pieces of candy for $\frac{1}{4}$ of a dollar.

<table>
<thead>
<tr>
<th>Dollars</th>
<th>Candies</th>
</tr>
</thead>
<tbody>
<tr>
<td>25</td>
<td>3</td>
</tr>
<tr>
<td>1</td>
<td>12</td>
</tr>
<tr>
<td>2</td>
<td>24</td>
</tr>
<tr>
<td>3</td>
<td>36</td>
</tr>
<tr>
<td>4</td>
<td>48</td>
</tr>
</tbody>
</table>

5. Alejandra bought $\frac{1}{4}$ of a pound of gummy bears for 2 dollars.

<table>
<thead>
<tr>
<th>Dollars</th>
<th>Pounds</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>.125</td>
</tr>
<tr>
<td>2</td>
<td>.25</td>
</tr>
<tr>
<td>4</td>
<td>.50</td>
</tr>
<tr>
<td>6</td>
<td>.75</td>
</tr>
<tr>
<td>8</td>
<td>1</td>
</tr>
</tbody>
</table>

6. Charlie swam part of a mini-triathlon 1/2 mile in 1/3 hour.
   a. What was his average speed? How do you know?

\[
\frac{1/2 \text{ miles}}{1/3 \text{ hour}} = \frac{1}{2} \cdot \frac{3}{2} = 1.5 \text{ miles/hour}
\]

b. Is the unit rate a proportional constant? Explain why or why not.
   Yes, at 0 hours Charlie swam 0 miles. This translates to the point (0,0) or the origin when graphed. Since there is a unit rate, the graph is a straight line.

c. What might the graph look like? (sketch if desired)
   A straight line going through the origin.
7. Carmen is making rice crispy treats for an upcoming bake sale. The number of marshmallows to the number of cups of crispy rice is proportionally related. If Carmen uses 36 jumbo marshmallows, she will need to use 6 cups of crispy rice.

a. Complete the table below to show the relationship between number of marshmallows and number of cups of crispy rice needed to make rice crispy treats.

<table>
<thead>
<tr>
<th>Number of Marshmallows (x)</th>
<th>Cups of Crispy Rice (y)</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>6</td>
<td>1</td>
</tr>
<tr>
<td>12</td>
<td>2</td>
</tr>
<tr>
<td>30</td>
<td>5</td>
</tr>
<tr>
<td>48</td>
<td>8</td>
</tr>
<tr>
<td>60</td>
<td>10</td>
</tr>
<tr>
<td>1</td>
<td>6</td>
</tr>
</tbody>
</table>

b. What is the proportional constant for this relationship?
The proportional constant for this relationship is \( \frac{1}{6} \).

c. Write an equation that shows the relationship between the number of marshmallows \( x \) and the number of cups of crispy rice \( y \) needed to make rice crispy treats.

\[ y = \frac{1}{6}x \text{ or } y = \frac{x}{6} \]

Students may try to argue that the proportional constant is 6. Point out that in this case that the number of marshmallows is defined as \( x \) and the cups of crispy rice is defined as \( y \) so \( y = \frac{1}{6}x \). If you were to switch the \( x \) and \( y \) variables than the proportional constant would be 6. This problem is foreshadowing the need for unit rate and how expressing the proportional constant as a unit rate can help us better understand and define the relationship.

8. Jane took 16 pounds of aluminum cans to the recycling center and received $12. She knows that the amount she earns is proportional to the number of pounds of cans she turns in.

a. What rate did the center pay for cans?

$0.75 per pound.

b. Write an equation that relates the pounds to the amount of money received.

\[ y = 0.75x \]

c. Graph this relationship on the grid below and highlight the unit rate/slope.

\[ \frac{9}{12} = 0.75 \]
4.2g Self-Assessment: Section 4.2

Consider the following skills/concepts. Rate your comfort level with each skill/concept by checking the box that best describes your progress in mastering each skill/concept. Corresponding sample problems, referenced in brackets, can be found on the following page.

<table>

<td>I can find rates from tables in BOTH ways. I can compare those rates in context using whichever is most appropriate.</td>
</tr>
</tbody>
</table>
Sample Problems for Section 4.2

1. Determine if each of the following pairs of rates are proportional.

<p>| | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>( \frac{3}{2} ) and ( \frac{2}{3} )</td>
<td>( \frac{5}{15} ) and ( \frac{10}{30} )</td>
<td>( 14 : 18 ) and ( 4 : 8 )</td>
</tr>
</tbody>
</table>

2. Last year, Sheryl got a Labrador puppy. The table below shows the age and weight of the puppy over several months. Graph the following relationship. Write a sentence justifying your placement of each variable.

<table>
<thead>
<tr>
<th>Weight of dog (in pounds)</th>
<th>Age of dog (in months)</th>
</tr>
</thead>
<tbody>
<tr>
<td>23</td>
<td>3</td>
</tr>
<tr>
<td>30</td>
<td>4</td>
</tr>
<tr>
<td>45</td>
<td>6</td>
</tr>
<tr>
<td>55</td>
<td>9</td>
</tr>
<tr>
<td>60</td>
<td>12</td>
</tr>
</tbody>
</table>

3. Given the following graphs, state whether each graph is proportional or not. Show or explain how you know. If it is proportional, find the unit rate.

a.

b.
4. For each table below, find the unit rate. Then explain the meaning of the point \((1, r)\).
   a. Kelsey’s run
      | Miles | Hours |
      | 1/2   | 1/8   |
      | 2     | 1/2   |
      | 3.5   | 7/8   |
      | 12    | 3     |
   b. Brand X Peanut Butter
      | Cost  | Ounces |
      | 13.92 | 48     |
      | 11.60 | 40     |

5. Find the unit rate for each table below. Then compare to the corresponding context in # 4.
   a. Romina’s run
      | Hours | Miles |
      | 1/2   | 2.5   |
      | 2     | 10    |
      | 4     | 20    |
      | 5     | 25    |
   b. Brand Y Peanut Butter
      | Cost  | Ounces |
      | 20.16 | 96     |
      | 6.30  | 30     |
      | 3.15  | 15     |
Section 4.3: Analyze Proportional Relationships Using Unit Rates, Tables, Graphs and Equations.

Section Overview:

In this section, students will extend fluency with graphs and tables and solidify writing equations for a proportional relationship. Throughout the section, there will be problems with relationships that are not proportional to be used as contrast to those that are. Problems in this section will have more steps and/or will be more advanced than those in section 4.2. By the end of the section, students should be able to go from any one representation to any other representation (graph to equation, equation to table, graph to table, etc.) and should be able to state what points on the graphs, solutions to the equation, or entries on the table mean in the context of the problem. For problems finding missing quantities, the emphasis should be on using the unit rate (scaling), equation, table, or graph to solve. Formal proportions and cross multiplication should not be used (these ideas will be solidified in chapter 5).

Key Ratio and Proportion Concepts from Utah Core Standards

RP Standard 1:
1. Extend the concept of a unit rate to include ratios of fractions.
2. Compute a unit rate, involving quantities measured in like or different units.

RP Standard 2:
3. Determine if two quantities expressed in a table or in a graph are in a proportional relationship.
4. Determine a unit rate from a table, graph, equation, diagram or verbal description and relate it to the constant of proportionality.
5. Write an equation for a proportional relationship in the form $y = kx$.
6. Explain the meaning of the point $(x,y)$ in the context of a proportional relationship.
7. Explain the significance of $(0,0)$ and $(1,r)$ in a graph of a proportional relationship, where $r$ is the unit rate.

RP Standard 3:
8. Solve multistep problems involving percent using proportional reasoning
9. Find the percent of a number and extend the concept to solving real life percent applications.
10. Calculate percent, percent increase, decrease, and error.

Primary Concepts and Skills to be Mastered in This Section

1. Write an equation for a proportional relationship from a table of values.
2. Write an equation for a proportional relationship from a graph.
3. Use rate to find a missing value in a table or context.
4. Use ratios to convert between units.
5. Explain why a relationship is or is not a proportional relationship.
4.3a Classroom Activity: Writing Equations from Patterns

Activity 1: Roberto is recovering from an injury. He increases the number of blocks he walks each day in the following pattern. (The arrow represents one street block.)

a. Draw the figure for Day 4 and write the number of blocks Roberto will walk.

b. Complete the table.

<table>
<thead>
<tr>
<th>Day (d)</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>8</th>
<th>14</th>
<th>16</th>
<th>23</th>
</tr>
</thead>
<tbody>
<tr>
<td>Blocks (b)</td>
<td>4</td>
<td>8</td>
<td>12</td>
<td>16</td>
<td>20</td>
<td>32</td>
<td>56</td>
<td>64</td>
<td>92</td>
</tr>
</tbody>
</table>

c. How did you figure out the number of blocks for 8 days and 14 days? What would you do to find the number of blocks for any given number of days? Multiply the number of days by 4

d. How did you find the number of days when you knew the number of streets? Divide by 4

e. What is the unit rate $\frac{blocks}{day} = \frac{4}{1}$? What is the unit rate $\frac{days}{block} = \frac{\frac{1}{4}}{1}$

f. Write equations to find
   - days for $b$ number of blocks $d = \frac{1}{4}b$
   - blocks for $d$ number of days $b = 4d$

   For reciprocal relationship: review the sunflower to rose example at the beginning of the chapter.
   Also: talk about the equation being the explicit way to show the relationship between the two quantities.

   g. How can you identify the unit rate in an equation of a proportional relationship?
      It’s the number right in front of the variable (called the coefficient).
**Activity 2:** For each sequence below: fill in the missing numbers, find the 50th term in the sequence and write equation(s) for the relationships found in the tables. Note: Write two equations for each example below (one for each possible unit rate). For numbers that are not integers, represent them in an exact form (i.e. without using a repeating decimal.)

<table>

**Practice:**

1. Complete the table below. Write an equation to show the relationship between the output (y value) to the input (x value). Then answer the questions.

<table>
<thead>
<tr>
<th>Number of Tickets (x)</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
<th>7</th>
</tr>
</thead>
<tbody>
<tr>
<td>Total cost (y)</td>
<td>$3$</td>
<td>$6$</td>
<td>$9$</td>
<td>$12$</td>
<td>$15$</td>
<td>$18$</td>
<td>$21$</td>
</tr>
</tbody>
</table>

| Equation:             | $y = 3x$ |

a. Is the relationship in this table proportional? **Yes**

b. What connections do you see between the unit rate, the table, and the equation? **Sample response:** I see the 3 in the table because every time you go up by 1 ticket, the cost goes up by 3. Also $y/x = 3$. In the equation the 3 is the constant of proportionality.

c. This equation gives you a rule when you input a number of tickets (x) to get an output of cost (y). Write the equation that does the opposite job: you input cost (y) and get an output of number of tickets (x). $x = \frac{1}{3}y$

d. What is the mathematical relationship between the constant of proportionality in the two equations? **They are reciprocals.**
2. Complete the table below. Write an equation relating the output (y value) to the input (x value). Then answer the questions.

<table>
<thead>
<tr>
<th># of Rides (x)</th>
<th>Cost (y)</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>$4</td>
</tr>
<tr>
<td>1</td>
<td>$6</td>
</tr>
<tr>
<td>2</td>
<td>$8</td>
</tr>
<tr>
<td>3</td>
<td>$10</td>
</tr>
<tr>
<td>4</td>
<td>$12</td>
</tr>
<tr>
<td>5</td>
<td>$14</td>
</tr>
<tr>
<td>8</td>
<td>$16</td>
</tr>
</tbody>
</table>

Equation: $y = 2x + 4$

a. Is the relationship in the table proportional? Explain. No

b. What connections do you see between the unit rate, the table, and the equation?
   Examples: The y’s go up by 2 each time. When there are 0 rides, the cost is 4. Another example: \( y/x \) is not always 2 because of the extra 4 dollar cost that doesn’t depend on the number of rides.

c. This equation gives you a rule when you input a number of rides (x) to get an output of cost (y). Write the equation that does the opposite job: you input a cost (y) and get an output of number of rides (x). \( x = \frac{1}{2}y - 2 \)

A student may instead look for a pattern and find \( x = \frac{1}{2}y - 2 \), and you could show why these expressions are equivalent.

---

Spiral Review

1. Maria is setting up a game for a school fundraiser carnival. The game will be a fishing pond with 300 rubber ducks. On the bottom of each rubber duck will be a either a red, blue or white sticker to indicate the type of prize the player will win. A red sticker will earn the player the top prize. Maria wants the probability of getting a red sticker to be 5%. On how many of the ducks should Maria affix a red sticker? 15

2. Factor the following expressions.
   \[ 3x - 6 \quad 3(x - 2) \quad 15 - 20y \quad 5(3 - 4y) \quad \frac{5}{3}x + \frac{2}{3} \quad \frac{1}{3}(5x + 2) \quad 4.9t - 2.8 \quad .7(7t - 4) \]

3. Use the distributive property to rewrite \( a(b + c) \) \( ab + ac \)

4. Use a model to solve \( 7 = 3x - 2 \) \( x = 3 \)

5. Chloe has twice as many cats as her sister has dogs. Her brother has 3 turtles. Together, they have six pets. How many of each pet do they have?
   Cats = 2
   Dogs = 1
   Turtles = 3
4.3a Homework: Writing Equations from Patterns

1. Complete the table below. Write an equation relating the output (y value) to the input (x value). Then answer the questions.

<table>
<thead>
<tr>
<th>Hours (x)</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
<th>7</th>
<th>Equation:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Miles Driven (y)</td>
<td>25</td>
<td>50</td>
<td>75</td>
<td>100</td>
<td>125</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

a. Is the relationship in the table proportional? Explain your answer.

b. What connections do you see between the unit rate, the table, and the equation?

c. This equation gives you a rule when you input a number of hours (x) to get an output of miles (y). Write the equation that does the opposite job: you input a miles (y) and get an output of hours (x).

   \[ x = \frac{1}{25} y \]

d. What is the mathematical relationship between the constant of proportionality in the two equations? They are reciprocals.

2. Complete the table below. Write an equation relating the output (y value) to the input (x value). Then answer the questions.

<table>
<thead>
<tr>
<th>Feet (x)</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
<th>10</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yards (y)</td>
<td>1/3</td>
<td>2/3</td>
<td>1</td>
<td>1</td>
<td>1/3</td>
<td>2/3</td>
<td></td>
</tr>
</tbody>
</table>

Equation:

   \[ y = \frac{1}{3} x \]

a. Is the relationship in the table proportional? Explain your answer.

b. What connections do you see between the unit rate, the table, and the equation?

c. This equation gives you a rule when you input a number of feet (x) to get an output of number of yards (y). Write the equation that does the opposite job: you input a number of yards (y) and get an output of number of feet (x).

d. What is the mathematical relationship between the constant of proportionality in the two equations?
4.3b Classwork: Writing Equations from Graphs

1. Use Graph A below to fill in the table relating calories to snacks.

<table>
<thead>
<tr>
<th>Number of Snacks</th>
<th>Calories</th>
<th>Ordered Pair</th>
<th>Write a complete sentence describing the meaning of this point on the graph.</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
<td>(0, 0)</td>
<td>Zero snacks have zero calories.</td>
</tr>
<tr>
<td>1</td>
<td>110</td>
<td>(1, 110)</td>
<td>One snack has 110 calories.</td>
</tr>
<tr>
<td>2</td>
<td>220</td>
<td>(2, 220)</td>
<td>Two snacks have 220 calories.</td>
</tr>
<tr>
<td>3</td>
<td>330</td>
<td>(3, 330)</td>
<td>Three snacks have 330 calories.</td>
</tr>
<tr>
<td>4</td>
<td>440</td>
<td>(4, 440)</td>
<td>Four snacks have 440 calories.</td>
</tr>
</tbody>
</table>

a. Is this a proportional graph? Why or why not?
   Yes, it is a straight line going through the origin.

b. What is the unit rate (include labels)? How do you know?
   110 calories per snack. Each time a snack is added the calories increase by 110.

c. Write the equation for calories related to number of snacks.
   \( y = 110x \)

d. Where does the unit rate show up on the graph? In the equation?
   Unit rate of 110 is found at point (1, 110). 110 is the coefficient of \( x \) in the equation.
2. Use Graph B to fill in the table relating cost to cab-ride distance.

<table>
<thead>
<tr>
<th>Miles</th>
<th>Cost</th>
<th>Ordered Pair</th>
<th>Write a complete sentence describing the meaning of this point on the graph.</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>$4</td>
<td>(0, 4)</td>
<td>The cab ride costs $4 just to start.</td>
</tr>
<tr>
<td>1</td>
<td>$5</td>
<td>(1, 5)</td>
<td>The cab ride costs $5 after 1 mile.</td>
</tr>
<tr>
<td>2</td>
<td>$6</td>
<td>(2, 6)</td>
<td>The cab ride costs $6 after 2 miles.</td>
</tr>
<tr>
<td>3</td>
<td>$7</td>
<td>(3, 7)</td>
<td>The cab ride costs $7 after 3 miles.</td>
</tr>
<tr>
<td>4</td>
<td>$8</td>
<td>(4, 8)</td>
<td>The cab ride costs $8 dollars after 4 miles.</td>
</tr>
</tbody>
</table>

a. Is this a proportional graph? Why or why not?
No, it does not start at (0,0)

b. Looking at the graph, describe what’s happening to the cost as miles increase.
The cost increases $1 for every mile.

c. Is there a unit rate? If so, what is the unit rate? Is the rate consistent for the entire graph? Explain.
The unit rate is not consistent for the entire graph.

d. Challenge: Write the equation relating cost to cab-ride distance. Explain the equation in words.
y = x + 4
It costs $4 just to hail the cab, and then $1 for every mile you go.
Again, you are not trying to teach y = mx + b.
4.3b Homework: Writing Equations from Graphs

1. Graph C:

   ![Graph C](image)

   a. Is this a proportional graph? Why or why not?

   b. Fill in the table above for the graph

   c. What is the unit rate (include labels)?

   d. Write the equation relating number of pictures taken to days on vacation.

2. Graph D:

   ![Graph D](image)

   a. Is this a proportional graph? Why or why not? Yes, it is a straight line through the origin.

   b. Fill in the table for the graph

   c. What is the unit rate (include labels)? $0.50 per ice cream bar

   d. Write the equation relating cost to number of ice cream bars purchased. $ y = 0.5x $
3. Graph E:

![Graph E](image)

a. Is this a proportional graph? Why or why not?

b. Fill in the table for the graph.

c. What is the unit rate (include labels)?

d. Write the equation relating pages written to hours spent.

4. Graph F:

![Graph F](image)

a. Is this a proportional graph? Why or why not?

b. Fill in the table for the graph:

c. What is the unit rate (include labels)?

d. Write the equation relating dollars (spent or earned) to days.
1. Place the fractions on the number line below.

\[-\frac{3}{4}, \quad \frac{5}{12}, \quad -1\frac{1}{4}, -\frac{4}{3}\]

2. Write \(\frac{1}{5}\) as a percent and decimal. \(20\%, \quad 0.2\)

3. Solve \(-3x + 5.5x + 4 = 7.2\) \(x = 1.28\)

4. Simplify the following expression. Use a model if needed. \(2(m - 1) + 3m - 4 + m \quad 6m - 6\)
4.3c Classroom Activity: Convert Units—Proportion in Tables and Graphs

A. Quarts related to Gallons:

Fill in the missing amounts of quarts and gallons. Then find the ratio for the number of quarts (y) to the number of gallons (x).

<table>
<thead>
<tr>
<th>Gal (x)</th>
<th>1</th>
<th>2</th>
<th>4</th>
<th>5</th>
<th>10</th>
<th>20</th>
<th>25</th>
<th>30</th>
<th>45</th>
<th>100</th>
<th>x</th>
</tr>
</thead>
<tbody>
<tr>
<td>Quarts (y)</td>
<td>4</td>
<td>8</td>
<td>16</td>
<td>20</td>
<td>40</td>
<td>80</td>
<td>100</td>
<td>120</td>
<td>180</td>
<td>400</td>
<td>4x</td>
</tr>
<tr>
<td>Ratio y/x</td>
<td>4</td>
<td>8</td>
<td>16</td>
<td>20</td>
<td>40</td>
<td>80</td>
<td>100</td>
<td>120</td>
<td>180</td>
<td>400</td>
<td>4x</td>
</tr>
</tbody>
</table>

1. What does the \( \frac{y}{x} \) ratio tell us? There are 4 quarts in one gallon.
2. Write an equation to show how to find the number of quarts in any number of gallons. \( y = 4x \)
3. Make a graph of the relationship between quarts and gallons (put gallons on the horizontal axis).

4. What does the graph tell us about the relationship of quarts to gallons? It is proportional.

5. On the graph, find the following coordinate points. What is the missing y value?
   - Point A (0, 0)
   - Point B (1, 4)
   - Point C (3, 12)
   - Point D (4, 16)

6. Draw the points and label them A, B, C, and D on the graph.

7. Describe how you “move” on the grid from one point to the next (you must stay on the grid lines to move from A to B, B to C, C to D). Use words like up, down, right, left, vertical, horizontal.
   - It moves up 4 units for every 1 unit it moves to the right.
8. How does this “moving” relate to rate? Unit rate is 4/1 up 4 over 1—same numbers.

9. Would the ordered pair (6, 26) lie on the graph? Why or Why not? No. \( y = 4x \), if \( x = 6 \), \( y = 24 \), not 26.
B. Feet related to yards:
Fill in the missing data.

<table>
<thead>
<tr>
<th>Yards (x)</th>
<th>1</th>
<th>2</th>
<th>4</th>
<th>5</th>
<th>10</th>
<th>16</th>
<th>25</th>
<th>30</th>
<th>48</th>
<th>100</th>
<th>x</th>
</tr>
</thead>
<tbody>
<tr>
<td>Feet (y)</td>
<td>3</td>
<td>6</td>
<td>12</td>
<td>15</td>
<td>30</td>
<td>48</td>
<td>75</td>
<td>90</td>
<td>144</td>
<td>300</td>
<td>3x</td>
</tr>
<tr>
<td>Ratio (\frac{y}{x})</td>
<td>(\frac{3}{1})</td>
<td>(\frac{6}{2})</td>
<td>(\frac{12}{4})</td>
<td>(\frac{15}{5})</td>
<td>(\frac{30}{10})</td>
<td>(\frac{48}{16})</td>
<td>(\frac{75}{25})</td>
<td>(\frac{90}{30})</td>
<td>(\frac{144}{48})</td>
<td>(\frac{300}{100})</td>
<td>(\frac{3x}{x})</td>
</tr>
</tbody>
</table>

10. What is the unit rate? How do you know? 3 feet per yard. All ratios simplify to \(\frac{3}{1} = 3\).

11. What did you do to find the number of feet in a given number of yards? Multiply by 3.

12. Write an equation to find the number of feet in a given number of yards. \(y = 3x\).

13. Predict the movement between points on a graph. Explain--use words like up, down, right, left, vertical, horizontal. It moves up 3 units for every 1 unit it moves to the right.

14. Sketch the graph, including labeling the axes.

---

C. Centimeters related to inches:
Fill in the missing data.

<table>
<thead>
<tr>
<th>Inches (x)</th>
<th>1</th>
<th>2</th>
<th>4</th>
<th>5</th>
<th>10</th>
<th>15</th>
<th>25</th>
<th>30</th>
<th>50</th>
<th>100</th>
<th>x</th>
</tr>
</thead>
<tbody>
<tr>
<td>Centimeters (y)</td>
<td>2.54</td>
<td>5.08</td>
<td>10.16</td>
<td>12.7</td>
<td>25.4</td>
<td>38.1</td>
<td>63.5</td>
<td>76.2</td>
<td>127</td>
<td>254</td>
<td>2.54x</td>
</tr>
<tr>
<td>Ratio (\frac{y}{x})</td>
<td>(\frac{2.54}{1})</td>
<td>(\frac{5.08}{2})</td>
<td>(\frac{10.16}{4})</td>
<td>(\frac{12.7}{5})</td>
<td>(\frac{25.4}{10})</td>
<td>(\frac{38.1}{15})</td>
<td>(\frac{63.5}{25})</td>
<td>(\frac{76.2}{30})</td>
<td>(\frac{127}{50})</td>
<td>(\frac{254}{100})</td>
<td>(\frac{2.54x}{x})</td>
</tr>
</tbody>
</table>

15. What is the unit rate? How did you find it? 2.54 centimeters per inch. All ratios simplify to \(\frac{2.54}{1}\).

16. What did you do to find the number of centimeters in a given number of inches?
   Write an equation to find the number of centimeters in a given number of inches. There are 2.54 centimeters in an inch. \(y = 2.54x\).

17. Predict the movement between points on a graph. Explain--use words like up, down, right, left, vertical, horizontal. It moves up 2.54 units for every 1 unit it moves to the right.

18. Sketch the graph, including labels for the axes.
1. Add $\frac{2}{7} + \frac{2}{3} = \frac{20}{21}$

2. Simplify the following expression. Use a model if needed. $71b - 4a + 4b + 4a - 75b - 8a$

3. Find the sum or product of each:
   
   a. $-3 + -7 = -10$
   b. $(-3)(-7) = 21$
   c. $-3 - (-7) = 4$
   d. $3 (-7) = -21$
   e. $-3 + 7 = 4$
   f. $-3 - 7 = -10$
4.3c Homework: Convert Units—Proportion in Tables and Graphs

A. Minutes related to Hours

Fill in the missing data.

<table>
<thead>
<tr>
<th>Hours (x)</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>5</th>
<th>10</th>
<th>15</th>
<th>x</th>
</tr>
</thead>
<tbody>
<tr>
<td>Minutes (y)</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Ratio ( \frac{y}{x} )</td>
<td>60</td>
<td>720</td>
<td>1200</td>
<td></td>
<td></td>
<td></td>
<td>( \frac{60x}{x} )</td>
</tr>
</tbody>
</table>

1. What is the unit rate? How do you know?

2. What did you do to find the number of minutes in a given number of hours?

3. Write an equation to find the number of minutes in a given number of hours.

4. Predict the movement between points on a graph. Explain--use words like up, down, right, left, vertical, horizontal.

5. Sketch the graph, including labeling the axes.

B. Hours related to Minutes: (use the table in #A above—the ratio would be reversed)

6. What is the unit rate? How do you know? \( \frac{1}{60} \) hour per minute.

7. What did you do to find the number of hours in a given number of minutes?
Write an equation to find the number of hours in a given number of minutes.

\[
\text{Divided by 60. } y = \frac{1}{60}x
\]

8. Predict the movement between points on a graph. Explain--use words like up, down, right, left, vertical, horizontal. It moves up 1 unit for every 60 units it moves to the right.

9. How will the graph be different than the graph in #A above? The coordinates for all the points are “reversed”, so what used to be a horizontal move will now be a vertical move and vice versa. So instead of being very steep, the graph will be very gradually sloped, and the numbers on the axes will be swapped. Note that even though the numbers are “swapped” the “steepness” goes in the same direction.
C. Kilometers related to miles:  (1 mile ≈ 1.6 kilometers)
Fill in the missing data.

<table>
<thead>
<tr>
<th>Miles (x)</th>
<th>1</th>
<th>2</th>
<th>4</th>
<th>5</th>
<th>10</th>
<th>25</th>
<th>100</th>
<th>x</th>
</tr>
</thead>
<tbody>
<tr>
<td>Kilometers (y)</td>
<td>4.8</td>
<td>8</td>
<td>19.2</td>
<td>80</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Ratio (\frac{y}{x})</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

10. What is the unit rate? How do you know?

11. How could you find the unit rate if the kilometers to miles equation wasn’t given?
   Use the given 8 kilometers to 5 miles and divide 8 by 5.

12. What did you do to find the number of kilometers in a given number of miles?
   Write an equation to find the number of kilometers in a given number of miles.
   Multiply by 1.6. \(y = 1.6x\)

13. Predict the movement between points on a graph. Explain—use words like up, down, right, left, vertical, horizontal. It moves up 1.6 units for every 1 unit it moves to the right.

14. Sketch the graph, including labels for the axes.

D. Miles related to Kilometers: (1 kilometer ≈ 0.62 mile) (Use the data in #C above—the ratio would be reversed)

12. What is the unit rate? How do you know?

13. How could you find the unit rate if the miles to kilometers equation wasn’t given?

14. What would you do to find the number of miles in a given number of kilometers?
   Write an equation to find the number of miles in a given number of kilometers.

15. Predict the movement between points on a graph. Explain—use words like up, down, right, left, vertical, horizontal.

16. How will this graph be different from the graph in #C above?
4.3d Extra Assignment: Revisit Unit Rate Situations, Write Equations

Answer the questions for each situation below.

1. It costs $0.80 to buy 4 apples. You want to buy 7 apples. How much will that cost?
   a. Write the two possible unit rates.
      20¢ per apple
      1/20 apple per cent.
   b. Which unit rate will help you solve the problem?
      20¢ per apple
   c. Create a table (at right) to show the unit rate increasing with each additional apple.
   d. Describe the number pattern you see in the table.
   e. Since you know the unit price, write a number sentence for finding the cost of 7 apples.
      \[ 7 \times \$0.20 = \$1.40 \]
   f. Write an equation to find the cost of any number \( (n) \) of apples.
      \[ y = 0.2n \]

2. At a bank in England, Ms. Vega wanted to exchange 20 U.S. dollars for Euros. The exchange rate was 3 U.S. dollars to 2 Euros. How many Euros did Ms. Vega receive?
   a. Write the two possible unit rates.
      \( \frac{3}{2} \) Euro per dollar
      1.5 dollars per Euro
   b. Which unit rate will help you solve the problem?
      \( \frac{3}{2} \) Euro per dollar
   c. Create a table (at right) to show the unit rate increasing with each additional dollar.
   d. Describe the number pattern you see in the table?
   e. Since you know the unit price, write a number sentence for finding how many Euros Ms. Vega will receive in exchange for 20 U.S. dollars.
      \[ 20 \times \frac{3}{2} = 13\frac{1}{2} \text{ Euros} \]
   f. Write an equation to find the amount of Euros received (3 dollars to 2 Euros) for any amount of U.S. dollars \( (d) \).
      \[ e = \frac{3}{2}d \]
3. Your dad can buy 4 tires for $360. He needs 6 new tires for the two family cars. How much will that cost?

a. Write the two possible unit rates.
   - $90 per tire
   - $1/90 tire per dollar

b. Which unit rate will help you solve the problem?
   - $90 per tire

c. Create a table (at right) to show the unit rate increasing with each additional tire.

d. Describe the number pattern you see in the table.

<table>
<thead>
<tr>
<th>Tires</th>
<th>Cost</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>1</td>
<td>$90</td>
</tr>
<tr>
<td>2</td>
<td>$180</td>
</tr>
<tr>
<td>3</td>
<td>$270</td>
</tr>
<tr>
<td>4</td>
<td>$360</td>
</tr>
<tr>
<td>5</td>
<td>$450</td>
</tr>
<tr>
<td>6</td>
<td>$540</td>
</tr>
</tbody>
</table>

e. Since you know the unit price, write a number sentence for finding the cost of 6 new tires.
   \[6 \times 90 = 540\]
f. Write an equation to find the cost of any number of tires \(t\).
   \[y = 90t\]

4. At a bank in Chile, Mr. Manycattle wanted to exchange 5000 pesos for U.S. dollars. The exchange rate was 1 U.S. dollars to 500 pesos. How many pesos did Mr. Manycattle receive?

a. Write the two possible unit rates.
   - $\frac{1}{500}$ per peso
   - 500 pesos per dollar

b. Which unit rate will help you solve the problem?
   - $\frac{1}{500}$ per peso

c. Create a table (at right) to show the unit rate increasing with each additional dollar.

d. Describe the number pattern you see in the table.

<table>
<thead>
<tr>
<th>Dollars</th>
<th>Pesos</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>1</td>
<td>500</td>
</tr>
<tr>
<td>2</td>
<td>1000</td>
</tr>
<tr>
<td>3</td>
<td>1500</td>
</tr>
<tr>
<td>4</td>
<td>2000</td>
</tr>
<tr>
<td>5</td>
<td>2500</td>
</tr>
<tr>
<td>6</td>
<td>3000</td>
</tr>
</tbody>
</table>

e. Since you know the unit price, write a number sentence for finding how many dollars Mr. Manycattle will receive in exchange for 5000 pesos.
   \[5000 \times \frac{1}{500} = 10\]
f. Write an equation to find the amount of dollars received (1 dollar to 500 pesos) for any amount of pesos \(p\).
   \[d = \left(\frac{1}{500}\right)p\]
4.3e Classroom Activity: Compare Proportional, Non-Proportional Patterns and Equations

Activity 1: Triangle Train

a. Fill in the table relating area to perimeter of the triangle trains at right.

b. Create the graph of that relationship (be sure to mark and label the axes).

c. Describe the growth of the perimeter as the stage areas increase.

   Perimeter is increased by 2 sides with each stage.

<table>
<thead>
<tr>
<th>Stage # or area</th>
<th>Perimeter</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>3</td>
</tr>
<tr>
<td>2</td>
<td>4</td>
</tr>
<tr>
<td>3</td>
<td>5</td>
</tr>
<tr>
<td>4</td>
<td>6</td>
</tr>
<tr>
<td>5</td>
<td>7</td>
</tr>
<tr>
<td>10</td>
<td>12</td>
</tr>
<tr>
<td>100</td>
<td>102</td>
</tr>
<tr>
<td>x</td>
<td>x + 2</td>
</tr>
</tbody>
</table>

Create the equation. Perimeter (triangle train) = \( P = x + 2 \)

Is the equation proportional? Why or why not? No, it does not start at (0,0)

Activity 2: Hexagon Train:

a. Fill in the table relating area to perimeter of the hexagon trains at right.

b. Create the graph of that relationship (be sure to mark and label the axes).

c. Describe the growth of the perimeter as the stage areas increase.

   Perimeter is increased by 4 sides with each stage.

<table>
<thead>
<tr>
<th>Stage # or area</th>
<th>Perimeter</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>6</td>
</tr>
<tr>
<td>2</td>
<td>10</td>
</tr>
<tr>
<td>3</td>
<td>14</td>
</tr>
<tr>
<td>4</td>
<td>18</td>
</tr>
<tr>
<td>5</td>
<td>22</td>
</tr>
<tr>
<td>10</td>
<td>42</td>
</tr>
<tr>
<td>100</td>
<td>402</td>
</tr>
<tr>
<td>x</td>
<td>4x + 2</td>
</tr>
</tbody>
</table>

d. Create the equation. Perimeter (hexagon train) = \( P = 4x + 2 \)

Is the equation proportional? Why or why not? No, it does not start at (0,0)
Activity 3: Staircase Volume and Surface Area

Build a 3 unit staircase using linking cubes.

- Fill in the table relating surface area to staircase volume.
- Create the graph of that relationship (be sure to mark and label the axes).
- Describe the growth of the volume as related to the stage.
  - Volume is increased by 3 units with each stage.
  - Surface area is increased by 10 units with each stage.
- Describe the growth of the surface area as related to the stage.

<table>
<thead>
<tr>
<th>Stage #</th>
<th>Volume</th>
<th>Surface Area</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>3</td>
<td>14</td>
</tr>
<tr>
<td>2</td>
<td>6</td>
<td>24</td>
</tr>
<tr>
<td>3</td>
<td>9</td>
<td>34</td>
</tr>
<tr>
<td>4</td>
<td>12</td>
<td>44</td>
</tr>
<tr>
<td>5</td>
<td>15</td>
<td>54</td>
</tr>
<tr>
<td>10</td>
<td>30</td>
<td>104</td>
</tr>
<tr>
<td>25</td>
<td>75</td>
<td>254</td>
</tr>
<tr>
<td>x</td>
<td>3x</td>
<td>10x + 4</td>
</tr>
</tbody>
</table>

- Create the equations. Volume (staircases) = \( V = 3x \) Surface Area (Staircases) = \( S = 10x + 4 \)
  - Are the equations proportional? Why or why not? Volume is proportional, surface area is not.

Activity 4: Build a 4 unit staircase. Follow the same steps.

- Describe the growth of the volume as related to the stage.
  - Volume is increased by 4 units with each stage.
  - Surface area is increased by 12 units with each stage.
- Describe the growth of the surface area as related to the stage.

<table>
<thead>
<tr>
<th>Stage #</th>
<th>Volume</th>
<th>Surface Area</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>4</td>
<td>18</td>
</tr>
<tr>
<td>2</td>
<td>8</td>
<td>30</td>
</tr>
<tr>
<td>3</td>
<td>12</td>
<td>42</td>
</tr>
<tr>
<td>4</td>
<td>16</td>
<td>54</td>
</tr>
<tr>
<td>5</td>
<td>20</td>
<td>66</td>
</tr>
<tr>
<td>10</td>
<td>40</td>
<td>126</td>
</tr>
<tr>
<td>25</td>
<td>100</td>
<td>306</td>
</tr>
<tr>
<td>x</td>
<td>4x</td>
<td>12x + 6</td>
</tr>
</tbody>
</table>

- Create the equations. Volume (4-unit staircases) = \( V = 4x \)
  - Surface Area (4-unit staircases) = \( S = 12x + 6 \)
  - Are the equations proportional? Why or why not? Volume is proportional, surface area is not.
Activity 5. Build a 5 unit staircase like the ones above (Activity 3 was a 3 unit staircase, Activity 4 was a 4 unit staircase). Follow the same steps.

a. Describe the growth of the volume as related to the stage.  
   Volume is increased by 5 units with each stage.

b. Describe the growth of the surface area as related to the stage.  
   Surface area is increased by 14 units with each stage.

c. Create the equations.  Volume (5 unit staircases) = \( V = 5x \)  
   Surface Area (5 unit staircases) = \( S = 14x + 8 \)  
   Are the equations proportional? Why or why not? Volume is proportional, surface area is not.

Activity 6: Using the patterns found in the equations for all of the previous “staircase patterns,” predict the equations for a six unit staircase without building the steps.

a. Volume (6-unit staircases) = \( V = 6x \)  
   Surface Area (6 unit staircases) = \( S = 16x + 10 \)  
   Are the equations proportional? Why or why not? Volume is proportional, surface area is not.

b. Use your equations to fill in the blanks in the table.

<table>
<thead>
<tr>
<th>Stage #</th>
<th>Volume</th>
<th>Surface Area</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>6</td>
<td>26</td>
</tr>
<tr>
<td>2</td>
<td>12</td>
<td>42</td>
</tr>
<tr>
<td>3</td>
<td>18</td>
<td>58</td>
</tr>
<tr>
<td>4</td>
<td>24</td>
<td>74</td>
</tr>
<tr>
<td>5</td>
<td>30</td>
<td>90</td>
</tr>
<tr>
<td>10</td>
<td>60</td>
<td>170</td>
</tr>
<tr>
<td>25</td>
<td>150</td>
<td>410</td>
</tr>
<tr>
<td>( x )</td>
<td>6( x )</td>
<td>16( x ) + 10</td>
</tr>
</tbody>
</table>
Spiral Review

1. Write 0.612 as a percent and fraction. \(61.2\% \ 612/1000 \text{ or } 153/250\)

2. If 4 gallons of gas cost $14.60, how much does 10 gallons of gas cost? $36.50

4. Find each product or quotient.
   
   1. \(6\left(\frac{1}{6}\right)\) -1  
   b. \(10 \div \frac{1}{2}\) -20

4. A mouse can travel 1.5 miles in \(\frac{3}{4}\) of an hour. At that pace,  
   a) how far can it travel in 1 hour? 2 miles  
   b) how long does it take it to travel one mile? \(\frac{3}{2}\) an hour
4.3e Homework: Write Equations from Tables, Patterns, Graphs

For each problem #1-5,

a. Find the unit rate in the form \( \frac{y}{x} \).

b. Write a unit rate statement ( ___miles per hour)

c. Write the equation.

1. 

<table>
<thead>
<tr>
<th>Hours</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
</tr>
</thead>
<tbody>

<td>16</td>
</tr>
</tbody>
</table>

Equation: \( p = 4x \)
Proportional (yes or no)? Yes
9. Equation: \( p = 6x - 2 \)

Proportional (yes or no)? No

10. Proportional? (yes or no) Yes

Unit rate \( \left( \frac{y}{x} \right) = \frac{6}{1} \)

11. Correct the error: The number of pages read and the time spent reading is proportional. Josie fills out the rate table below.

a) What mistake did Josie make?

b) Use another representation to show that her table doesn’t show a proportional relationship.

c) Correct the entries in her table.

12. Correct the error: Marcus is filling out a rate table below, which shows a proportional relationship between the amount of snow accumulated and the hours it has been snowing at a constant rate.

a) What mistake did Marcus make? He squared the inches of snow to get the time instead of multiplying by 2.

b) Use another representation to show that his table doesn’t show a proportional relationship.

\[ \frac{1}{2} \neq \frac{1}{3} \neq \frac{1}{4} \neq \frac{1}{5} \]

c) Correct the entries in his table. 6, 8, 10
4.3f Classroom Activity and Homework: Time Trials (Rates of Speed)

In this activity, you will compare the rate of speed of two battery operated toy vehicles.

- Create a runway in the classroom. Test out the cars on the runway. You might use the width of the classroom or a certain distance in the hallway.
- Determine what your units of measurement will be. For example, tiles per second (if your classroom has tiles), centimeters per second, inches per second, feet per second, etc.
- Practice timing, (for example counting the seconds on a watch with a second hand or starting and stopping a stop watch).
- Do some trial runs to practice.
  - You might mark time and distance by having one person drop a cube or marker behind the car as the second person counts off each second.
  - You will measure the distance between markers and record in the table below.
- You will probably want to do one car (or toy) at a time.

1. Begin the trial. Collect the data for time and distance. After the data is collected, complete the table.

**Toy # 1**

<table>
<thead>
<tr>
<th>Time (in sec)</th>
<th>Distance (in ____)</th>
<th>Ratio ( \frac{dist}{time} )</th>
<th>Ratio (as a decimal)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Toy # 2**

<table>
<thead>
<tr>
<th>Time (in sec)</th>
<th>Distance (in ____)</th>
<th>Ratio ( \frac{dist}{time} )</th>
<th>Ratio (as a decimal)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
2. Analyze the data.
   a. What does the ratio of distance and time tell you?
      This is the distance traveled during that unit of time, so it’s the speed.
   b. Why is it helpful to change the \( \frac{\text{dist}}{\text{time}} \) ratio to a decimal? Because the decimals are easier to
      compare by just glancing, while fractions with unlike denominators are difficult to compare.
   c. What is the unit rate for the two vehicles? How did you figure it out?

3. Create the graph to chart the data for both vehicles (toys). Label the axes and the graph. Label the graphed
   lines as 1\textsuperscript{st} and 2\textsuperscript{nd} Vehicle or with the names.

4. Compare the speeds of the two cars. Write your comparison below. Use the words, the math and the graphs
   to help you. This comparison might involve…
   a. Explaining the data in the table.
   b. Explaining the unit rate
   c. Explaining how you arrived at the unit rate (considering that your measurement tools weren’t
      exactly accurate).
   d. Describing the graph.
4.3g Class Activity and Homework: Jet Ski Rentals—Proportional vs. Non-proportional Equations

Activity 1: Your dad has researched renting personal water-crafts (jet skis) for your family vacation. He found the following two cost fee plans:
   a. Rental plan A: $30.00 initial one time rental fee plus $45.00 per hour.
   b. Rental plan B: $50.00 per hour with no initial one time rental fee.

Create data tables to show how much it will cost to rent jet skis from each company.

<table>
<thead>
<tr>
<th>Rental Plan A</th>
<th>Rental Plan B</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hours</td>
<td>Expression for Total Cost</td>
</tr>
<tr>
<td>1</td>
<td>$30(1) + $45(1)</td>
</tr>
<tr>
<td>2</td>
<td>$30(1) + $45(2)</td>
</tr>
<tr>
<td>3</td>
<td>$30(1) + $45(3)</td>
</tr>
<tr>
<td>4</td>
<td>$30(1) + $45(4)</td>
</tr>
<tr>
<td>5</td>
<td>$30(1) + $45(5)</td>
</tr>
<tr>
<td>x</td>
<td>$30(1) + $45(x)</td>
</tr>
</tbody>
</table>

Create graphs for each situation on the same grid. Label the axes. Put a title on the graph. Label graphed lines by plan A or B.
Answer the questions related to the two plans shown on the tables and graphs above.

a. How long can you rent a jet ski if your family has budgeted $350 for the rental fee?
b. Look at the tables. Compare the total cost to the number of hours for each row of the table. Is there a set unit rate? Does the table show a proportional relationship for this plan?
c. Write a sentence and an equation that relates the total cost, y, and the number of hours, x.
d. Use your graph to find the cost to rent one jet ski for 10 hours.
e. Explain why and when you would choose to use each plan.

<table>
<thead>
<tr>
<th>Plan A</th>
<th>Plan B</th>
</tr>
</thead>
<tbody>
<tr>
<td>a.</td>
<td>a. 7 hours.</td>
</tr>
<tr>
<td>b.</td>
<td>b.</td>
</tr>
<tr>
<td>c. $480</td>
<td>c.</td>
</tr>
<tr>
<td>e.</td>
<td>e.</td>
</tr>
</tbody>
</table>

4. Explain how you can determine whether or not a relationship is proportional or non-proportional…
   a. …looking at tables.
      If there is a constant ratio for each of the rows then the relationship is proportional.
   b. …looking at graphs.
      If the graph starts at the origin (0,0) and is a straight line, then the relationship is proportional.
   c. …looking at equations.
      If the only number in the equation is multiplied or divided with the x then the relationship is proportional.

Spiral Review

1. Estimate by rounding to the nearest integer. $\frac{3\frac{1}{3}}{\frac{7}{9}} \approx \frac{\blank}{\blank} \approx \frac{\blank}{\blank}$
   $\approx 3 \div 1 \approx 3$
   Is your answer an over estimate or under estimate, explain? Under estimate

2. David is in a submarine at 200 feet below sea level. Casey is above him in a helicopter at 5,900 feet altitude. How far apart are David and Casey? $5,900 - (-200) = 6,100ft$.

3. Find each difference without a model.
   a. $16 - 29 = -13$    b. $-2 - (-8) = 6$    c. $-90 - 87 = -177$    d. $5 - (-3) = 8$
### 4.3h Self-Assessment: Section 4.3

Consider the following skills/concepts. Rate your comfort level with each skill/concept by checking the box that best describes your progress in mastering each skill/concept. Corresponding sample problems, referenced in brackets, can be found on the following page.

<table>
<thead>
<tr>
<th>Skill/Concept</th>
<th>Beginning Understanding</th>
<th>Developing Skill and Understanding</th>
<th>Practical Skill and Understanding</th>

Sample Problems for Section 4.3

2. Write an equation for each of the following proportional relationships from either a table or a graph.
   a. 
      | Months | Books Read | Equation: |
      | 1      | 2          |           |
      | 3      | 6          |           |
      | 5      | 10         |           |
      | 7      | 14         |           |
   
   b. 
      | Guests at Party | Cost |
      | 2             | $5.60|
      | 6             | $16.80|
      | 10            | $28  |
      | 14            | $39.20|

   c. 

   d. 

3. Use the rate to find the missing value(s) in each problem:
   a. Roxana bikes to and from work every day. She bikes 28 miles in two days. She bikes 42 miles in three days. How many miles does she bike in five days?
   
   b. Chocolate Milkshake Recipe
      | Chocolate Syrup | Vanilla Ice Cream |
      | ?              | 1 cup             |
      | 10 Tbsp        | ?                 |
      | 20 Tbsp        | 10 cups           |
c. **Filling Buckets of Sand**

<table>
<thead>
<tr>

</thead>
<tbody>
<tr>
<td>( \frac{3}{4} ) cups</td>
<td>( 2 \frac{1}{4} ) cups</td>
</tr>
<tr>
<td>?</td>
<td>1 cup</td>
</tr>
<tr>
<td>( \frac{1}{2} ) cups</td>
<td>?</td>
</tr>
</tbody>
</table>

f. **Sebastian walks \( \frac{1}{2} \) mile in \( \frac{1}{6} \) of an hour. How far does he walk in a half hour?**

4. Convert the following units using the ratios given:

a. \( 20 \text{ mL} = \_\_\_\_\_\_L \) (1 L = 1000 mL)

b. \_\_\_\_\_\_ feet = 37 inches (1 foot = 12 inches)

c. \( \frac{3}{4} \) tons = \_\_\_\_\_\_ pounds (1 ton = 2000 pounds)

5. Look at each of the following situations. Explain why it is or isn’t proportional.

a. **Recipe for Pizza**

<table>
<thead>
<tr>
<th>Pizza Diameter</th>
<th>Cheese</th>
</tr>
</thead>
<tbody>
<tr>
<td>6 in</td>
<td>78 g</td>
</tr>
<tr>
<td>12 in</td>
<td>312 g</td>

Section 4.4: Analyze and Use Proportional Relationships and Models to Solve Real-World and Mathematical Problems.

Section Overview:

The concepts studies in sections 4.1 - 4.3 will be applied throughout this section. The formal definition of a proportion will be introduced, and students will set up and solve proportions for real-world problems, including problems with percentages of increase and decrease. It’s likely, especially for advanced classes, that before the topic is formally introduced students will set up proportions and solve them (a) using properties of equality, (b) by finding a common denominator on both sides, or even (c) by cross multiplying, if they have seen this in previous years or at home. Any method that can be justified using proportional reasoning can lead to a meaningful discussion. Students should be encouraged to justify their answer with other representations (graph, bar model, table, or unit rates) to bring out the possible misconception that proportions can be solved with an additive rather than a multiplicative strategy (e.g. $\frac{1}{2} = \frac{3}{6}$ so $\frac{1+3}{2} = \frac{3+3}{6}$ but $\frac{1+3}{2} \neq \frac{3+3}{6}$).

In addition to solving proportions algebraically, students will examine part-to-whole ratios and compare them to the part-to-part ratios they have been using in the first three sections of the chapter. Odds and probability will be examined together to give students practice in fluently switching between part-to-part and part-to-whole relationships and solving for missing quantities using either type of ratio.

Key Ratio and Proportion Concepts from Utah Core Standards

RP Standard 1:
1. Extend the concept of a unit rate to include ratios of fractions.
2. Compute a unit rate, involving quantities measured in like or different units.

RP Standard 2:
3. Determine if two quantities expressed in a table or in a graph are in a proportional relationship.
4. Determine a unit rate from a table, graph, equation, diagram or verbal description and relate it to the constant of proportionality.
5. Write an equation for a proportional relationship in the form $y = kx$.
6. Explain the meaning of the point $(x, y)$ in the context of a proportional relationship.
7. Explain the significance of $(0,0)$ and $(1,r)$ in a graph of a proportional relationship, where $r$ is the unit rate.

RP Standard 3:
8. Solve multistep problems involving percent using proportional reasoning
9. Find the percent of a number and extend the concept to solving real life percent applications.
10. Calculate percent, percent increase, decrease, and error.

Primary Concepts and Skills to be Mastered in This Section

1. Rewrite a part:part ratio as a part:whole ratio and vice versa.
2. Find any missing value in ratio relationships with a model.
3. Write a proportion to find missing values.
4. Solve a proportion equation.
5. Explain the difference between probability and odds.
4.4a Classroom Activity: Use Models to Solve Proportional Problems

**Review:** On a quiz, the ratio of Fernanda’s correct to incorrect answers is 3:2. If she got 12 correct, how many were incorrect and what was the total number of problems?

<table>
<thead>
<tr>
<th>Model Step 1: Draw the model to match the ratio and label.</th>
<th>Model Step 2: Match the numbers to the model and solve. Since there are 3 parts for 12 correct answers, then each part is worth 4.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Correct</td>
<td>Incorrect</td>
</tr>
<tr>
<td><img src="image1.png" alt="Diagram" /></td>
<td><img src="image2.png" alt="Diagram" /></td>
</tr>
</tbody>
</table>

The incorrect number is 8 and the total number of problems is 20.

**Example 1:**
The ratio of boys to girls in math club last year was 3 boys to 5 girls. This year, the amount of boys tripled, while the amount of girls doubled. Now there are 133 kids in math club. How many kids were in the club last year?

This time you have a ratio of 3:5, but you don’t know how many “items” are in each group:

<table>
<thead>
<tr>
<th>(boys)</th>
<th>(boys)</th>
<th>(boys)</th>
<th>(girls)</th>
<th>(girls)</th>
<th>(girls)</th>
<th>(girls)</th>
<th>(girls)</th>
</tr>
</thead>
</table>

The above diagram represents the club last year. Next modify the diagram to represent the club this year:

<table>
<thead>
<tr>
<th>(boys)</th>
<th>(boys)</th>
<th>(boys)</th>
<th>(girls)</th>
<th>(girls)</th>
<th>(girls)</th>
<th>(girls)</th>
<th>(girls)</th>
</tr>
</thead>
<tbody>
<tr>
<td>(boys)</td>
<td>(boys)</td>
<td>(boys)</td>
<td>(girls)</td>
<td>(girls)</td>
<td>(girls)</td>
<td>(girls)</td>
<td>(girls)</td>
</tr>
<tr>
<td>(boys)</td>
<td>(boys)</td>
<td>(boys)</td>
<td>(girls)</td>
<td>(girls)</td>
<td>(girls)</td>
<td>(girls)</td>
<td>(girls)</td>
</tr>
</tbody>
</table>

Notice there are three times as many sections for the boys, and twice as many for the girls. The entire diagram represents 133 kids. Remember that each section has the same number of items (people) in it.

How many people must be in each section? Then how many kids were in the club last year?

There are a total of 19 parts (each with the same number of people in each part). We divide 133 by 19 and find that there are 7 in each part. Thus there are 7×9 or 63 boys and 7×10 = 70 girls this year. Last year there were 21 boys and 35 girls.
Practice: Solve each problem, using a model or equation as needed.

1. You uncle wants the ratio of flowers and vegetables planted his garden to be 3 flowers : 4 vegetables. He has space for 91 plants. How many flowers should he plant?
   39 flowers and 52 vegetables

2. A recipe for sauce calls for a ratio of 1 part butter to 3 parts chocolate. You want to make a total of 2 pounds of total sauce. How much butter and how much chocolate should you use?
   ½ lb butter and 1½ lbs chocolate

3. The lengths of two ribbons are in the ratio 2:5. If the length of the longer ribbon is 20 inches, find the length of the shorter ribbon.
   8 inches

4. The lengths of three ribbons are in the ratio 3:5:7. If the length of the longest ribbon is 42 centimeters, find the lengths of the other ribbons.
   30 cm and 18 cm

5. The number of male teachers is 2/3 of the number of female teachers in a school. If there are 75 teachers altogether, how many more female teachers than male teachers are there?
   15 more female teachers; 30 men and 45 women

6. The ratio of the number of cars to the number of motorcycles is 6:2. If there are 30 cars, how many motorcycles are there?
   10 motorcycles
7. The ratio of the number of cars to the number of vans is 2:1. The ratio of the number of vans to the number of motorcycles is 3:5.
   a. Draw a model representing cars to vans to motorcycles.

   b. If there are 25 motorcycles, how many cars are there? Explain.
      30 cars; 15 vans: 25 motorcycles therefore 30 cars: 15 vans

   c. Find the simplified ratio of the number of cars to the number of vans to the number of motorcycles. Explain.
      6:3:5, reduce numbers calculated in part b

8. The ratio of the number of Rocio’s postcards to the number of Troy’s postcards is 2:7. Together, they have 72 postcards. How many postcards does Rocio have?
   Rocio has 16 postcards and Troy has 56

9. Members of the book club voted for their favorite snack. Four out of every 7 votes were for ice cream. The other votes were for fruit. If ice cream received 32 votes, how many votes did fruit receive?
   Fruit received 24 votes

10. The ratio of time spent on homework to time spent babysitting your little sister was 4:9 yesterday. Today, you spent double the amount of time on your homework, but you spent the same amount of time taking care of your sister. It took you a total of 204 minutes today for homework and babysitting. How many minutes did you spend on homework today?
    96 minutes on homework and 108 minutes on babysitting.

11. Both Joe and Conner have the same amount of money. If Joe gives 1/3 of his money to Conner, what will be the ratio of Joe’s money to Conner’s?
    2 : 4 or 1 : 2

12. Half of Sergio’s money is the same amount as one-fourth of Henry’s money. If Henry has $60 more than Sergio, how much do they each have?
    Henry has $120 and Sergio has $60
4.4a Homework: Use Models to Solve Proportional Problems

Solve each problem, using a model or equation as needed.

1. Zoey made some trail mix by combining raisins and chocolate in a 3:4 ratio. Zoey used 18 ounces of raisins. How many ounces of chocolate were used?
   
   24 oz chocolate

2. For every 2 miles that I run, Rubio runs 5 miles. If I ran 12 miles last week, how many miles did Rubio run?

3. For every 8 sit-ups that Clara can do, Angela can do 3. If Clara did 96 sit-ups, how many more sit-ups did Clara do than Angela?
   
   Angela did 36 sit-ups so Clara did 96 – 36 = 60 more sit-ups.

4. The ratio of the number of rock songs to the number of country songs on my MP3 player is 6:1. If there are 42 rock songs on my MP3 player, how many country songs are there?

5. Rafael, Victor, and Gabriel raised money for the Housing Project in the ratio 6:3:2. Rafael raised $120. How much money was raised altogether?

6. At first, he ratio of John’s money to Peter’s money was 4:7. After John spent half of his money and Peter spent $60, Peter had twice the amount of money as John. How much money did John have at first?
   
   John originally had $80, Peter originally had $140

7. Alice, Ben and Carol shared a sum of money they received. Alice received 1/5 of the money. The rest of the money was divided between Ben and Carol in the ratio 1:3. If Carol received $6 more than Alice, how much money did Ben receive?
4.4b Classroom Activity: Writing Proportions

This lesson will introduce a proportion as another way to find missing quantities in proportional relationships.

Review: Jennifer received $9.00 for 2 hours of babysitting. At this rate, if she baby-sat for 27 hours last month, how much did she make?

- We have solved similar problems from tables. Solve this problem using the table, and explain your reasoning in the space next to the table.

<table>
<thead>
<tr>
<th>Hours (x)</th>
<th>2</th>
<th>1</th>
<th>27</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dollars (y)</td>
<td>9</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

If I divide the pay by hours, I can see that Jennifer makes $4.50 per hour. The ratio of $y : x$ is always $4.5 : 1$ so I can solve the proportion equation $4.5/1 = y/x$ for any $x$ or $y$; e.g. the relationship between hours ($x$) and dollars ($y$) is $4.5x = y$. If $x = 27$ then $y = 4.5 \times 27 = 121.50$.

- We have also solved similar problems using graphs. Solve this problem using the graph below, and explain the reasoning next to the graph.

Because each point represents a pair of numbers that could be in the table, I need to find which point has an $x$ coordinate of 27. Then the $y$ coordinate is the correct number of dollars, so it’s $121.50$.

- We have also solved similar problems using bar models. Solve this problem using the bar model below, and explain your reasoning in the space next to the bar model.

2 hours is the “same” as $9$. So each hour is $4.50$. To get 27 hours, we multiply 27 by $4.50$.

9 dollars
• We have used equations to solve problems like this also. By reading the thought bubble, explain how the equation can be used to solve the problem.

9 dollars in 2 hours gives a unit rate of $4.50 per hour. Every hour represents $4.50, so multiply the number of hours by the unit rate. Then the equation is $D = 4.50H$, where $H$ is the number of hours and $D$ is the number of dollars.

I substitute my known quantity, 27, for the correct variable, $H$ for hours. I simplify the expression $4.50(27)$ to get 121.5.

• Another way to solve this problem is to set up an equation of two equal ratios, and then solve that equation. An equation showing that two ratios are equal is a called a proportion, because it applies to proportional relationships.

\[
\frac{a}{b} = \frac{c}{d}
\]

This proportion means “$a$ is to $b$ as $c$ is to $d$”

Be sure you are consistent in the units of the quantities you are comparing. In the proportion below, both quantities are comparing dollars to hours:

Proportion showing \(\frac{\text{dollars}}{\text{hours}}\) : \(\frac{9}{2} = \frac{D}{27}\)

“9 dollars is to 2 hours as how many ($D$) dollars is to 27 hours?”

Is this the only possible proportion for the question? Explain.

There are a number of ways this proportion can be written. \(2/9 = 27/D\); focus on consistent ratio across proportion.

What strategies can you use to solve the proportion \(\frac{9}{2} = \frac{D}{27}\)?

Encourage students to connect strategies to previous ideas with tables, graph and rates.

Note: a proportion can be two ratios comparing different quantities (like apples and oranges or children and adults) or ratios comparing two different units for the same event/quantity (like miles and hours or dollars and servings).
Example 1: A 5 inch frog can leap 50 inches in one jump! If jumping distance were proportional to body length, how far should a 60 inch human be able to jump? Set up two possible proportions.

Solution:
We will first compare body length to jumping distance:

\[
\frac{\text{body}}{\text{jumping}} : \frac{5}{50} = \frac{60}{J}
\]

Then we will compare jumping distance to body length:

\[
\frac{\text{jumping}}{\text{body}} : \frac{50}{5} = \frac{J}{60}
\]

Set up two proportions for each problem. Be sure to write the units of your comparisons. You don’t need to solve for the missing quantity yet. You will come back and solve these problems as part of 4.4c homework.

1. Pablo won 2 out of 3 chess games one day. At this rate, if he played 33 games, how many did he win?

He won 22 games \(\frac{\text{won}}{\text{played}}\): \(\frac{2}{3} = \frac{x}{33}\) or \(\frac{\text{played}}{\text{won}}\): \(\frac{3}{2} = \frac{33}{x}\)

2. Nalini and Hugo won first and second place in the spelling contest. They had to share a cash prize in the ratio 8:5. Nalini received 72 dollars. How much did Hugo receive?

Hugo received $45 \(\frac{\text{first}}{\text{second}}\): \(\frac{8}{5} = \frac{72}{x}\) or \(\frac{\text{second}}{\text{first}}\): \(\frac{5}{8} = \frac{x}{72}\)

3. Bargain Betty’s sells sneakers and scooters in the ratio 3:8. The store sold 21 sneakers yesterday. How many scooters were sold?

56 scooters were sold \(\frac{\text{sneakers}}{\text{scooters}}\): \(\frac{3}{8} = \frac{21}{x}\) or \(\frac{\text{scooters}}{\text{sneakers}}\): \(\frac{8}{3} = \frac{x}{21}\)

4. In 1.5 hours, a sprint-race sled dog can run 30 miles. How long would it take the dog to run 12 miles?

0.6 hours \(\frac{\text{hours}}{\text{miles}}\): \(\frac{1.5}{30} = \frac{x}{12}\) or \(\frac{\text{miles}}{\text{hours}}\): \(\frac{30}{1.5} = \frac{12}{x}\)

5. Bliss chocolates have 220 calories for 6 pieces. How many pieces should you eat if you want 150 calories of chocolate?

\(\approx 4\) pieces \(\frac{\text{calories}}{\text{pieces}}\): \(\frac{220}{6} = \frac{150}{x}\) or \(\frac{\text{pieces}}{\text{calories}}\): \(\frac{6}{220} = \frac{x}{150}\)
4.4b Homework: Writing Proportions

For each problem, write the two proportions that represent the problem. You do not need to solve them now. You will come back and solve them as part of the homework for the next section.

1. 12-packs of soda are on sale for 5 for $12. At this rate, what is the cost for three 12-packs?

2. You are making a cinnamon sugar topping for your Snicker Doodles.
   a. The ratio of cinnamon to sugar is 1:4. You use 3 tablespoons of cinnamon. How much sugar?
   b. A different recipe has a ratio of cinnamon to sugar that is 2:3. If you need a total of 20 tablespoons of topping, how much cinnamon and sugar will you need?

   \[
   \frac{\text{cinnamon}}{\text{total}} = \frac{2}{5} \quad \text{and} \quad \frac{\text{sugar}}{\text{total}} = \frac{3}{5} = \frac{y}{20}
   \]

   Or you could do total as numerator for either proportion.

3. For your batch of cookies, you'll need 2 cups of chocolate chips for every 5 cups of cookie dough mix.
   a. You have 30 cups of cookie dough mix, how many cups of chocolate chips?
   b. You have 1 cup of chocolate chips, how much cookie dough mix do you need?

4. Students are collecting cans of food for the needy. They count cans every 3 days and get an average of 145 cans when they count. At this rate, how many cans will they have at the end of the month (20 school days)?
4.4c Class Activity: Solving Proportions

The following proportion compares two quantities:
\[
\frac{3}{x} = \frac{5}{9}
\]
means “3 is to what number, as 5 is to 9?”

What is another comparison that could be made between the two quantities?

What number is to 3, as 9 is to 5; 3 is to 5 as some number is to 9; etc.: \[
\frac{x}{3} = \frac{9}{5}
\]

Now consider the equation \[
\frac{x}{3} = \frac{9}{5}
\]. Whether the numbers came from a ratio with like units, a rate with unlike units, or fractions, we can solve this equation for \(x\) using the multiplication property of equality. Example #1 shows a path for the solution. Write a justification of why each step shows an equation with the same solution as the previous step.

Example #1: Write a justification for each step, using algebraic properties.

<table>
<thead>
<tr>
<th>Equation</th>
<th>Justification</th>
</tr>
</thead>
</table>
| \[
\frac{x}{3} = \frac{9}{5}
\] | Given |
| \[
(3)\frac{x}{3} = \frac{9}{5}\cdot(3)
\] | Multiplication property of equality: multiplying by 3 to both sides of the equation |
| \[
\frac{3x}{3} = \frac{27}{5}
\] | Simplifying each expression |
| \[
x = \frac{27}{5}
\] | 3/3 is 1 so on the left we have \(x\); on the right we have \(27/5\) or \(5\ 2/5\). |

For the proportions below, solve using properties of equality. You may reverse the order of the ratio comparison.

1. \[
\frac{3}{2} = \frac{12}{x}
\]
   8

2. \[
\frac{5}{2} = \frac{8}{x}
\]
   3.2

3. \[
\frac{5}{x} = \frac{2}{3}
\]
   7.5

4. \[
\frac{3}{2} = \frac{y}{1}
\]
   1½

5. \[
\frac{x}{27} = \frac{4}{6}
\]
   18

6. \[
\frac{9}{x} = \frac{6}{5}
\]
   7.5

©2014 University of Utah Middle School Math Project in partnership with the Utah State Office of Education. Licensed under Creative Commons, cc-by.
4.4c Homework: Solving Proportions

Solve each proportion using properties of equality.

1. $\frac{5}{3} = \frac{15}{x}$

4. $\frac{5}{3} = \frac{y}{1} \quad 1\frac{1}{3}$

2. $\frac{2}{4} = \frac{x}{15}$

5. $\frac{5}{x} = \frac{9}{6} \quad 7.5$

3. $\frac{7}{3.5} = \frac{9}{x}$

6. $\frac{9}{x} = \frac{12}{8}$

After solving problems # 1 – 6, go back and solve the problems from section 4.4b (where you wrote proportion equations but did not yet solve).
4.4d Class Activity: PART-TO-PART and PART-TO-WHOLE Proportion Problems

Use models and equations to solve the problems below.

a. Ginger and her brother Cal shared some stamps in the ratio 3:1. If Cal had 5 stamps, how many stamps did Ginger have?

   Ginger has 15 stamps

b. Ginger and Cal have some stamps. Three out of four of the stamps belong to Ginger. How many stamps do they each own if there are 20 total stamps?

   Ginger has 15 stamps and Cal has 5 stamps

1. How are the problems different? Which one is part-to-part? part-to-whole?

   Problem a. is part-to-part and problem b. is part-to-whole.

2. Write proportion equations for finding the missing number. Use a model if necessary.
   a. In a group of 72 people, 2 out of every 9 people are left-handed. How many people are right-handed?

   56 people are right handed, 16 are left handed

b. Five out of 8 students voted for Jose. The other students voted for Carlos. If 39 students voted for Carlos, how many students voted in all?

   104 students voted in all
3. Rewrite the problems a. and b. from #2 above to be part-to-part. Draw models to solve. Write proportion equations to find the missing number.
   a. In a group of 72 people, the ratio of left-handed to right-handed people is 2:7. How many people are right handed?

   b. The ratio of students voting for Jose and Carlos was 5:3. If 39 students voted for Carlos, how many students voted in all?

4. The ratio of rock tunes to jazz tunes on Abby’s iPod is 3:2. If Abby has 12 jazz tunes, how many rock tunes does she have? Use a model to solve. Then write a proportion equation for finding the missing number.

   She has 18 rock tunes

5. Rewrite the problem from #4 above to be part-to-whole. Draw a model to solve. Write a proportion equation to find the missing number.

   3 out of every 5 tunes on Abby’s iPod is a rock tune. If the rest are jazz tunes, and she has 12 of them, how many rock tunes does she have?
Label the ratio in the problem as part-to-part (pp) or part-to-whole (pw). Draw models if desired.

Write proportion equations to solve. (Be careful! To answer the question, you might have to do two steps.)

- Divide # 6-21 below evenly in your groups of four (count off every fourth problem).
- All students will do #22.
- Work in pairs to complete one each of the individually assigned problems.
- Pair check the other three individual problems.
- Present problems in groups of four. As students present their problems, other group members complete the problems and critique if needed.

6. Two numbers are in the ratio 9:5. If the smaller number is 20, what is the sum of the two numbers?

   The sum is 56, (pp)

7. Clarence the Clown has 20 purple and pink balloons to give out to children at the circus. 1 out of 4 balloons is pink. How many more balloons are purple?

   16 balloons are purple, (pw)

8. One out of every 4 children attending the art show is a girl. There are 21 boys. What is the total number of children at the art show?

   There are 28 children at the art show, (pw)

9. Tina and Alma shared a cash prize in the ratio 6:7. If Alma received 35 dollars, how much money did Tina receive?

   Tina received $30, (pp)

10. Maria downloaded pop tunes and hip hop tunes to her computer in the ratio 3:2. She has 10 hip-hop tunes. How many more pop tunes than hip-hop tunes does Maria have?

   She has 5 more pop tunes than hip-hop tunes, (pp)

11. Jorge built a gaming website. The website had 40 visitors on Monday. Three out of every 8 visitors played Planet Zak. The other visitors played Cosmic Blobs. How many visitors played Cosmic Blobs?

   25 visitors played Cosmic Blobs, (pw)

12. For every 4 candy bars that Ella sells, Ben sells three. Ella sold 24 candy bars last month. How many candy bars did Ben sell?

   Ben sold 18 candy bars, (pp)

13. The ratio of the weight of Christian’s hamster to the weight of Javier’s hamster is 1:3. Christian’s hamster weighs 7 ounces. How much do the two hamsters weigh together?

   Together they weigh 28 ounces (pp)
14. Gustavo spends 4 out of every 5 dollars he earns on software. He uses the rest of the money to buy snacks. Last month, Gustavo spent 20 dollars on software. How much less money did he spend on snacks?

He spent $5 on snacks and $20 on software so he spent $15 less on snacks than software. (pw)

15. Kevin spends 3 out of every 4 dollars he earns on games. He uses the rest of the money to buy comic books. Last month, Kevin spent 18 dollars on games. How much less money did he spend on comic books?

He spent $24 total, $6 on comic books and $18 on games. This is $12 less on comic books. (pw)

16. The ratio of the weight of Rachel’s radio to the weight of Belle’s radio is 5:7. Rachel’s radio weighs 35 ounces. How much less does Rachel’s radio weigh than Belle’s radio?

Rachel’s radio weighs 14 ounces less than Belle’s radio, (pp)

17. Mrs. Ruiz has 20 students in her class. One out of 4 students stayed after school yesterday for soccer practice. The other students stayed for band. How many students stayed for band practice?

15 students stayed for band practice, (pw)

18. For every 7 push-ups Dulce can do, Sara can do 6. If Dulce did 28 push-ups during gym class. How many push-ups did they do altogether?

They did 52 push-ups together, (pp)

19. The ratio of the number of comic books in Yazmin’s collection to the number of comic books in Itzel’s collection is 4:1. Itzel has 6 comic books. How many comic books do they have altogether?

They have 30 comic books altogether, (pp)

20. A group of fourth grade students voted for their favorite sport. One out of 9 students voted for baseball. The other students voted for basketball. There were a total of 36 votes. How many students voted for basketball?

32 students voted for basketball, (pw)

21. Angela and Diana share some lollipops in the ratio 4:7. Diana has 28 lollipops. How many lollipops do they have altogether?

Together they have 44 lollipops, (pp)

22. (All students do this problem.) A recipe calls for a ratio of flour and water to be \( \frac{1}{2} : \frac{1}{3} \). Sara has 2 cups of flour. How many cups of water does she need?

1⅓ cups of water, (pp)
4.4d Homework: PART-TO-PART and PART-TO-WHOLE Proportion Problems

1. Write proportion equations for finding the missing number and then solve, using a model if necessary.
   a. Edgar and Raul participated in a team bike-a-thon. Edgar rode 6 out of every 7 miles in the course. Raul covered the rest of the mileage. If Edgar rode 48 miles, how many miles did Raul ride?

   b. The school basketball team won 1 out of every 5 games it played this season. The team lost 36 games. Assuming there were no ties, how many games did the team play this season?

       The team played 45 games total

2. Rewrite the problems from #1 above to be part-to-part. Draw models to solve. Write proportion equations to find the missing number.
   a. Edgar and Raul participated in a team bike-a-thon. Edgar rode 6 miles for every 1 mile Raul rode. If Edgar rode 48 miles, how many miles did Raul ride?

   b. 
3. Yesterday, Brainy Games sold robots and chess sets in the ratio 2:3. The store sold 16 robots. How many toys were sold in all? Use a model to solve. Then write proportion equations for finding the missing number.

4. Rewrite the problem from #3 above to be part-to-whole. Draw a model to solve. Write a proportion equation to find the missing number.

Label the ratio in each problem as part-to-part (pp) or part-to-whole (pw). Draw models if desired. Write proportion equations to solve. (Be careful—to answer the question, you might have to do two steps.)

5. For every 3 hats that Lexi sells, Maddie sells two. Lexi sold 12 hats last month. How many hats did they sell in all?

20 hats all together, (pp)

6. For every 7 games the Cherico Cheetahs played, the team won 6. If the Cherico Cheetahs won 30 more games than they lost, how many games did they win?

7. A website conducted a survey about musical tastes. According to the survey, 1 out of 8 people prefers hip hop music. The others prefer rock music. If 56 people took part in the survey, how many more people prefer rock music?

42 more people prefer rock, (pw)

8. On Friday morning, Harmon’s had 35 boxes of Captain Crush on the shelf. 1 out of every 5 boxes contained a prize. How many boxes did not contain a prize?

9. Marco and Justin shared a cash prize in the ratio 3:4. If Justin received 16 dollars, how much money did Marco receive?

Marco received $12, (pp)
10. The ratio of girls to boys at the track meet was 4:1. Eric counted 9 boys. How many children were at the track meet altogether?

11. One out of every 4 children attending the soccer game is a girl. There are 27 boys. What is the total number of children at the soccer game?

12. Clarence the Clown has 36 pink and white balloons to give out to children at the circus. 1 out of 4 balloons is white. How many more balloons are pink?

    There are 27 pink balloons and 9 white balloons so 18 more are pink. (pw)

13. The ratio of the length of Jake’s wire to the length of Maddie’s wire is 1:4. Maddie’s wire measures 28 inches. How long is Jake’s wire?

    Jake’s wire is 7 inches long, (pp)

14. For every 7 sit-ups Naomi can do, Morgan can do 6. If Naomi did 49 sit-ups, how many more sit-ups did Naomi do than Morgan?

15. On Wednesday morning, Smith’s had 99 boxes of Sweet Smacks on the shelf. 4 out of every 11 boxes contained a prize. How many boxes did not contain a prize?

16. Kyle and Megan participated in a team bike-athon. Kyle rode 5 out of every 8 miles in the course. Megan covered the rest of the mileage. If Kyle rode 45 miles, how many fewer miles did Megan ride than Kyle?

17. For every 3 books that Corey sells, Lexi sells one. Corey sold 21 books last week. How many fewer books did Lexi sell than Corey?

    Lexi sold 14 fewer books than Corey, (pp)

18. Will and Abby shared some marshmallows in the ratio 7:3. Abby had 27 marshmallows. How many fewer marshmallows did Abby have than Will?
4.4e Extra Assignment: Use Models or Proportion Equations

Use a model or proportion equations to solve for the missing value.

1. The ratio of cheerleaders to football players at the game is 3:4. There are 21 cheerleaders. How many football players are there? 28 football players

2. The ratio of purple jellybeans to green jellybeans is 4:9. There are 45 green jellybeans. How many purple jellybeans are there?

3. The ratio of Phineas to Ferb toys at the toy store is 5:11. If there are 35 Phineas toys, how many Ferb toys are there?

    77 Ferb toys

4. The ratio of blue birds to gerbils at the pet store is 4:16. At the store there are 10 blue birds. How many gerbils are there?

5. The ratio of triangles to rectangles is 3:7. There are 21 triangles. How many rectangles are there?

6. The ratio of roses to sunflowers is 2:12. There are 4 roses. How many sunflowers are there?

    24 sunflowers

7. The ratio of trumpet players to flute players is 16:23. There are 46 flute players. How many trumpet players are there?

8. In a class, there is a ratio of 3 boys to 2 girls. There are 10 girls. How many boys are there?

9. In a recipe, the ratio of oil to sugar is 3: 1.25. You have 3.75 cups of sugar. How much oil will you need?

    9 cups of oil

10. To make the right paint color, you have a ratio of 4 parts blue: 2 parts yellow: 3 parts brown. You have 16 parts blue. How much yellow and brown do you need to use all the blue paint?

11. To make paste, you need the ratio of \( \frac{3}{5} \) cups water to \( \frac{3}{4} \) cups flour. If you have 3 cups of water how many cups of flour do you need? \( \frac{3}{4} \) cups of flour
4.4f Classroom Activity: Odds and Probability: Chance Proportions

**Activity 1:** A school basketball team wins 3 games for every 1 game it losses. So, the odds that the school basketball team will lose a game is 1:3. Is this a part-to-part or part-to whole ratio? Explain any parts or wholes.

Part to part: 1 loss (part) to 3 wins (part)

Rework the statement above to state the probability of the basketball team winning. Would this be part-to-part or part-to whole? Explain any parts or wholes.

The probability of winning is 3/4; 3 wins (part) to 4 games played (whole)

What is the difference between odds and probability?

**Odds are part-to-part & probability is part-whole.**

Draw models if desired. Set up proportion equations to find needed information to answer the questions.

1. The chance of getting “heads” when you flip a coin is $\frac{1}{2}$. What are the odds of flipping “heads”? If you flip a coin 80 times, how many times (theoretically) would you expect to get “heads”?

   Odds are 1:1, expect heads 40 times on 80 flips

2. The odds of randomly guessing the answer right on a multiple choice test are 1:4. What is the probability of guessing the correct answer? If the test has 20 questions, how many of them would I expect to guess correctly?

   Probability is 1/5, expect 4 correct answers on 20 questions

3. The chance of rain during April is $\frac{5}{6}$. How many days can you expect rain during the month of April?

   25 days of rain. (Note, there are 30 days in April.)

4. What is the probability of rolling a number less than 3 on a six-sided number cube? What are the odds? If you roll the cube 27 times, how many rolls (theoretically) would have a number less than 3?

   Probability is $\frac{2}{6} = \frac{1}{3}$, odds are 1:2, 9 of the rolls should come up less than 3

5. The probability of spinning an even number on a given spinner is $\frac{2}{9}$. If you spin the spinner 91 times, approximately how many of them would you expect to be even?

   $\approx 20$ times

6. A certain student is late for school 3 out of 8 times. What are the odds for him/her to be late? If there are 180 days of school, how many days would he/she likely be late?

   The odds are 3:5, the student can be expected to be late 67 or 68 days

7. Cami has a record for winning Tic-Tac-Toe 3 out of 7 times. What are the odds for Cami to win? What is the probability of her winning? How many games would she need to play in order to be likely to win 12 games?

   The odds are 3:4, the probability is 3/7, she would have to play 28 games
4.4f Homework: Odds and Probability: Chance Proportions

Set up proportion equations to help find needed information to answer the questions. Draw models if desired.

1. The chance of snowfall on any day in February is \(\frac{6}{7}\). What are the odds of snow on a day in February? If there are 28 days in February, how many of those days would you expect there to be snow fall?

   Odds are 6:1; 24 days.

2. Approximately 12 out of every 100 males are left-handed. What are the odds that a randomly chosen boy is left-handed? Out of 75 boys how many of them would you expect to be left-handed?

3. Over time, you have found that your probability of bowling at least one strike in a game is \(\frac{3}{10}\). What are the odds of getting at least one strike in a game? If you bowled 24 games, about how many games would you expect to bowl at least one strike?

4. The odds of finding a four-leaf clover in a clover patch are 1:34. What is the probability that a certain clover has four leaves? If I pick 245 clovers, how many of them would I expect to have four leaves?

   Probability is 1/35; 7 of them

5. The odds of getting an even number on a given spinner are 4:3. What is the probability of getting an even number on this spinner? How many times would you expect to spin the spinner if you wanted to land on an even number 32 times?

6. The probability of randomly selecting a pair of blue socks from a given sock drawer is \(\frac{5}{9}\). If I randomly draw a pair of socks 45 times, how many of those draws (theoretically) will result in a pair of blue socks?

7. The odds of selecting a green marble from a given bag are 5 : 18. How many times (theoretically) would I need to randomly select marbles in order to pull out a green marble 75 times?

   345 times
4.4g Classroom Activity: Percent Proportions

Review: Percentage involves part-to-whole relationships. If we use percent in a proportion equation, we write the percent as a fraction out of 100, for example 72% is \( \frac{72}{100} \). In a percent proportion equation, we would always be looking to find one of three possible missing pieces of information, the “percent” out of 100, the “part”, or the “whole”. \( \frac{\text{percent}}{100} = \frac{\text{part}}{\text{whole}} \).

1. A survey reveals 252 out of 350 students in 7th grade like to read. What percent like to read? Write a percent proportion equation to solve this question.
   \[ \frac{x}{100} = \frac{252}{350} \]

2. 72% of the students in 8th grade like to read and there are 350 students in 8th grade. How many students in 8th grade like to read? Write the percent proportion equation to solve this question.
   \[ \frac{72}{100} = \frac{x}{350} \]

3. Let’s say 72% of the students in 6th grade like to read and we know that 252 students like to read, but we don’t know how many students are in 6th grade. Write the percent proportion equation to answer this question.
   \[ \frac{72}{100} = \frac{252}{x} \]

Write proportion equations to find the answer to the questions posed below. Then solve the problem.

4. You are taking a math test and you get 32 problems correct on the test. Your grade is 80%. How many problems were on the test?
   \[ \frac{80}{100} = \frac{32}{x} \]; 40 problems

5. Your best friend takes a math test with 40 problems. She solves 75% of the problems correctly. How many problems did your friend get correct?
   \[ \frac{75}{100} = \frac{x}{40} \]; 30 problems

6. Another friend gets 36 out of 40 problems correct. What percent did your friend solve correctly?
   \[ \frac{x}{100} = \frac{36}{40} \]; 90%

7. Tony bought a CD on sale for $3 off the original price of $15. What percent was the CD marked down?
   \[ \frac{7x}{100} = \frac{3}{15} \]; 20%

8. Serena got the same CD as Tony for $10.50 at another store. What percent did she get off?
   \[ \frac{x}{100} = \frac{4.50}{15} \]; 30%

9. Eddie bought a book of sports stories. It was 25% off the original price of $15. How much did he pay?
   \[ \frac{25}{100} = \frac{x}{15} \]; \$15 – x = \$11.25
   OR (25% off means pay 75% of price)
   So \( \frac{75}{100} = \frac{y}{15} \) and \( y = \$11.25 \).

10. There are 75 students in the eighth grade. 45 of those go to music class. The rest of the students have art. What percent have art? music?
    \[ \frac{x}{100} = \frac{45}{75} \]; Art is 40%, Music is 60%

11. Of all the 8th grade students, 60 walk to and from school. If 80% of 8th graders walk to and from school, how many students are in 8th grade?
    \[ \frac{80}{100} = \frac{60}{x} \]; 75 students
4.4g Homework: Write and Solve Three Percent Problems:

- Brainstorm as a class to make a list of situations in which you might find percent problems.
- In your groups of four, decide on four different contexts for writing percentage problems.
- Assign one to each member of the group.
- Each member of the group writes three word problems.
  - One in which the percent is not known but the “whole” and “part” are known.
  - One in which the percent and the “whole” are known, but the “part” is not known.
  - One in which the percent and the “part” are known, but the “whole” is not known.
- Each member of the group solves the three word problems he/she wrote.
- Group members present and critique problems and solutions.
- Twelve completed problems are turned in as homework for the group.
4.4h Classroom Activity: Unit Rates and Proportions in Markups and Markdowns

Review:

**Activity 1:** A sales manager at a clothing store is decreasing prices on six items by 20%.

a. Draw a bar model to show a decrease of 20% off the original cost of an item.

We find 20% of the original (by cutting it up into 5 parts) and then remove that part. We are left with 80% of the original.

b. Suppose one of the items is a scarf that originally cost $14.50. What would the sale price for the scarf be? $11.60

c. Explain in your own words this relationship: \( \frac{\text{percent}}{100} = \frac{\text{part}}{\text{whole}} \)
d. Use the relationship in c. to write a proportional relationship between percentage and the cost of the scarf.

\[
\frac{80}{100} = \frac{\text{sale price}}{\text{original price}} \quad \text{or} \quad \frac{80}{100} = 11.60 \quad \frac{80}{100} = 14.50
\]

The original price is $14.50, we want 80% of the amount (since there was a 20% discount and 100% − 20% = 80%). Note: percent is part of a whole that is 100; we want part of a whole that is $14.50.

e. Use. Using your model, proportions, or another method, find the sale price for each item (sale price of each item is 20% off original price):

<table>
<thead>
<tr>
<th>Original price (x)</th>
<th>$14.50</th>
<th>$18.00</th>
<th>$25.25</th>
<th>$40.10</th>
<th>$39.95</th>
<th>$5.00</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sale price (y)</td>
<td>$11.60</td>
<td>$14.40</td>
<td>$20.20</td>
<td>$32.08</td>
<td>$31.96</td>
<td>$4.00</td>
</tr>
</tbody>
</table>

f. What is the unit rate? \( \frac{\text{sale price}}{\text{original price}} = \frac{0.8}{1} \)

g. Convert your unit rate into a percentage and use your model to explain why this makes sense.

\[ 80\% \text{ because } \frac{0.8}{1} = \frac{80}{100} \text{ and a 20% discount means paying 80\% of original price.} \]

h. Write an equation for \( y \), the sale price. Verify that your equation is true for two columns in the table.

\( y = 0.8x \)
i. If the sale price is $29.80 for a pair of shoes at this store, how much was the original price?

$37.25

j. Use a calculator or graph paper to graph the ordered pairs for (original price, sale price). What do you notice? The ordered pairs line up on a straight line through the origin, so they represent a proportional relationship.
Activity 2: A used car dealership marks up the cost of the cars they buy at auctions by 75%.

a. Draw a bar model for increasing by 75%, where the original bar represents the original cost of the car at auction.

We find 75% of the original (first model) and then add it to the original amount. Thus, we have 1 “original” plus 0.75 of the original; or 1.75 of the original.

b. If 100% is the original whole, what part of the original is the new amount? Justify your answer.

175%. It is 100% of the original plus 75% of the original.

c. Use a proportion in the form \( \frac{\text{percent}}{100} = \frac{\text{part}}{\text{whole}} \) to find the selling price (part) for a car whose original auction price (whole) was $1500.

\[
\frac{175}{100} = \frac{x}{1500}; \quad x = 2,625
\]

d. Using your model, proportions, or another method, find the selling price if there is always a 75% mark-up of the auction price:

<table>
<thead>
<tr>
<th>Auction price (x)</th>
<th>$1500</th>
<th>$1900</th>
<th>$1750</th>
<th>$6400</th>
<th>$9350</th>
<th>$6044</th>
</tr>
</thead>
<tbody>
<tr>
<td>Selling price (y)</td>
<td>$2,625</td>
<td>$3,325</td>
<td>$3,062.50</td>
<td>$11,200</td>
<td>$16,362.50</td>
<td>$10,577</td>
</tr>
</tbody>
</table>

e. What is the unit rate for \( \frac{\text{selling price}}{\text{auction price}} = \frac{1.75}{1} \)

f. Write an equation for \( y \), the selling price. Verify that your equation is true for two columns in the table.

\( y = 1.75x \)

g. If you go to the car dealership and see a selling price of $7700, how much did the car cost at auction? Justify your answer.

$4,400

h. Using a graphing calculator or on graph paper, graph the ordered pairs (auction price, selling price). What do you notice? See student responses
Activity 3: Find the missing price for each. Use a unit rate, proportional constant, proportions or models to solve, showing your work.

a. Original price: $16.20  
   Increase by 40%  
   Final price: $22.68  
   Unit rate = 1.4

f. Original price: $55.00  
   Increase by 150%  
   Final price: $137.50  
   Unit rate = 2.5

Remind students to first identify the whole, e.g. to what does the 100% refer? This is key in setting up their proportions or creating models.

b. Original price: $1050.00  
   Increase by 0.5%  
   Final price: $1055.25  
   Unit rate = 1.005

g. Original price: $100.00  
   Decrease by 20%  
   THEN increase by 20%  
   Final price: $100 \times (0.80 \times 1.20) = $96.00  
   How does this compare with the original price?

On problems g. and h., help students understand that the second percent increase/decrease applies to the “whole” from the first step. In problem g. the 20% increase applies to a smaller whole ($80) than the original price of $100. Therefore, the 20% increase doesn’t make up for the 20% decrease.

h. Original price: $80  
   Increase by 15%  
   THEN decrease by 15%  
   Final price: $80 \times (1.15 \times 0.85) = $81.20  
   How does this compare with the original price?

i. Original price: $40.00  
   Decrease by 25% (product is on sale)  
   THEN increase by 6% (pay sales tax)  
   Final price: $40 \times (0.75 \times 1.06) = $31.80

j. Original price: $150.00  
   Decrease by 30% (item is on sale)  
   THEN decrease by 10% (apply store coupon)  
   Final price: $150 \times (0.70 \times 0.90) = $94.50

c. Original price: $19.80  
   Decrease by 5%  
   Final price: $18.81  
   Unit rate = 0.95

d. Original price: $86.60  
   Decrease by 85%  
   Final price: $12.99  
   Unit rate = 0.15

e. Original price: $29.00  
   Increase by 180%  
   Final price: $81.20  
   Unit rate = 2.8

Activity 4. Find the unit rate for each of problems a – f above in activity 3. You may need to remind students that unit rate is output/input thus in this case it is: \( \frac{\text{final price}}{\text{original price}} \) which is the same as the percentage.  
Percentage of increase is \( \frac{100 + \% \text{ increase}}{100} \); percentage of decrease is \( \frac{100 - \% \text{ decrease}}{100} \).
4.4h Homework activity: Unit Rates in Markups and Markdowns

1. All the dimensions of a drawing must be decreased by 15%.
   a. Draw a bar model for decreasing by 15%, where the original bar represents the original length of an object in the drawing.

   a. Using your model or another method, find the length if it is decreased by 15%:

<table>
<thead>
<tr>
<th>Original length (x)</th>
<th>18 cm</th>
<th>9.6 cm</th>
<th>12 cm</th>
<th>1 cm</th>
<th>22.8 cm</th>
<th>32 cm</th>
</tr>
</thead>
<tbody>
<tr>
<td>Final length (y)</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

   b. What is the unit rate of \( \frac{\text{length in final picture}}{\text{length in original picture}} \)?

   c. Convert your unit rate into a percentage and use your model to explain why this makes sense.

   d. Write an equation for \( y \), the final length. Verify that your equation is true for two columns in the table.

   e. If the roof of a barn in the final picture is 20.4 cm long, how long was the roof of the barn in the original picture?

       24 cm

2. At the bake sale fundraiser, George marks up all items 40% to make a profit for the math club.
   a. Draw a bar model for increasing by 40%.

   b. Using your model or another method, find the new price if the original is increased by 40%:

<table>
<thead>
<tr>
<th>Original price (x)</th>
<th>$0.50</th>
<th>$1.00</th>
<th>$0.75</th>
<th>$1.05</th>
<th>$3.00</th>
<th>$2.50</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sale price (y)</td>
<td>$0.70</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>$3.50</td>
</tr>
</tbody>
</table>

   c. What is the unit rate of \( \frac{\text{sale price}}{\text{original price}} \)?

   d. Convert your unit rate into a percentage and use your model to explain why this makes sense.

       140% because \( \frac{1.4}{1} = \frac{140}{100} \)

   e. Write an equation for \( y \), the sale price. Verify that your equation is true for two columns in the table.

       \( y = 1.4x \)

   f. If you go to the bake sale and purchase a brownie for $3.15, how much did the brownie originally cost? Justify your answer.
3. Find the missing price for each. Use a unit rate, bar model, or equation to solve. Show your work.
   a. Original price: $22.00
      Increase by 40%
      Final price:
   f. Original price: $35.00
      Increase by 250%
      Final price:

   b. Original price: $9000.00
      Decrease by 0.5%
      Final price: $8,955
   g. Original price: $60.00
      Decrease by 25%
      THEN increase by 25%
      Final price: $1.25 \times (0.75 \times $60) = $56.25
      Compare the final price to original price and explain any differences.

   c. Original price: $39.80
      Decrease by 10%
      Final price:
   h. Original price: $100.00
      Decrease by 30%
      THEN increase by 10%
      Final price:

   d. Original price: $173.20
      Decrease by 85%
      Final price: $25.98
   i. Original price: $72.00
      Increase by 12.5%
      THEN increase by 10%
      Final price:

   e. Original price:
      Increase by 120%
      Final price: $66.00
   j. Original price: $900.00
      Decrease by 40%
      THEN decrease by 5%
      Final price:
4.4i Anchor Problem Revisited: Purchasing Tunes-Town Music Company

I. Considering all you’ve learned in chapter 4, revisit this problem. How might you enhance your original response to this problem (which we considered at the beginning of chapter 4)? Prepare a response to present to the class.

What’s the Better Deal
(From illustrative mathematics.org)

Beat-Street, Tunes-Town, and Music-Mind are music companies. Beat-Street offers to buy 1.5 million shares of Tunes-Town for $561 million. At the same time, Music-Mind offers to buy 1.5 million shares of Tunes-Town at $373 per share.

1. Who would get the better deal, Beat-Street or Music-Mind? Why?

2. What is the total price difference?

II. Now consider a different situation for Purchasing Tunes-Town Music Company. Prepare a response to present to the class.

Price Per Share (variation 2)
(from illustrative mathematics.org)

Beat-Street, Tunes-Town, and Music-Mind are music companies. Beat-Street and Music-Mind are teaming up together to make an offer to acquire 1.5 million shares of Tunes-Town worth $374 per share. They will offer Tunes-Town 20 million shares of Beat-Street worth $25 per share. To make the swap even, they will offer another 2 million shares of Music-Mind.

What price per share (in dollars) must each of the shares of Music-Mind be worth?
**4.4j Self-Assessment: Section 4.4**

Consider the following skills/concepts. Rate your comfort level with each skill/concept by checking the box that best describes your progress in mastering each skill/concept. Corresponding sample problems, referenced in brackets, can be found on the following page.

Sample Problems for Section 4.4

1. Rewrite the following part:part ratios as part:whole ratios. Include labels of units.
   a. The ratio of boys to girls in Gabrielle’s family is 3:8.
   b. On a recent quiz, Felipe’s ratio of correct to incorrect problems is 5:1.
   c. A slushie recipe calls for 2 parts frozen fruit to 1 part juice.

2. a. Rewrite the following part:whole ratio as a part:part ratio.
   Eida likes to travel. The ratio of states Eida has visited to the total states is 19:25.

   b. Rewrite the following part:part ratio as a part:whole ratio.

3. Find the missing information given the ratios in each problem using a model. (Extra challenge: connect your model to another method of finding the missing information.)
   a. Another slushie recipe calls for a 3:1 ratio of water to juice. If you use one cup water, how much juice would you use?

   b. The ratio of two numbers is 8:9. If the larger number is 18, find the sum of the two numbers.

   c. Daniel got 4 out of every 5 questions correct on a recent multiple choice test. If he got 64 questions correct, how many did he miss?

4. Write a proportion equation and use it to find the missing information in each problem.
   a. At the local city park, the ratio of ducks to geese is 25:9. If there are 18 geese, how many ducks are there?

   b. Scientists tag fish in a pond. When they check back a few months later, the ratio of tagged to untagged fish is 1:6. If they captured 21 fish, how many fish were tagged?

   c. In the above fish pond, they originally tagged 20 fish. How many fish would the scientists predict are in the pond?
5. Solve the following proportion equations:

<p>| | | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>

<tbody>
<tr>
<td>a. ( \frac{3}{4} = \frac{15}{x} )</td>
<td>b. ( \frac{9}{x} = \frac{15}{25} )</td>
<td>c. ( \frac{x}{6} = \frac{1}{4} )</td>
<td>d. ( \frac{4}{27} = \frac{x}{3} )</td>
</tr>
</tbody>
</table>

6. Alex and Ben love to play with toy cars. One day, Ben brings his 12 cars over to play with Alex and his 15 cars. Alex’s baby sister comes and grabs one of the cars.

a. What is the probability that she picks one of Alex’s cars?

b. What are the odds that she picks one of Alex’s cars?

c. Explain how the answers to part a. and part b. are similar. Explain how they are different.

7. Use proportional reasoning (unit rate, proportional constant, and/or proportion equations) to solve for the following missing price:

a. Original price: $65.00
Decrease by 30%
Final price: $65.00

b. Original price: $36.50
Increase by 45%
Final price: $36.50

c. Original price:
Decrease by 20%
Final price: $67.20

d. Original price:
Increase by 120%
Final price: $127.60

e. Original price: $125.00
Decrease by 20% (product is already on sale)
THEN decrease by 15% (extra coupon is applied)
Final price: $125.00

f. Original price: $59.00 (wholesale price)
Increase by 50% (store mark up)
THEN decrease by 25% (product is on sale)
Final price: $59.00
Chapter 5: Geometric Figures and Scale Drawings (3-4 weeks)

UTAH CORE Standard(s)

Draw construct, and describe geometrical figures and describe the relationships between them.

1. Solve problems involving scale drawings of geometric figures, including computing actual lengths and areas from a scale drawing and reproducing a scale drawing at a different scale. 7.G.1
2. Draw (freehand, with ruler and protractor, and with technology) geometric shapes with given conditions. Focus on constructing triangles from three measures of angles or sides, noticing when the conditions determine a unique triangle, more than one triangle, or no triangle. 7.G.2

Solve real-life and mathematical problems involving angle measure, area, surface area, and volume.

4. Know the formulas for the area and circumference of a circle and use them to solve problems; give an informal derivation of the relationship between the circumference and area of a circle. 7.G.4
5. Use facts about supplementary, complementary, vertical, and adjacent angles in a multi-step problem to write and solve simple equations for an unknown angle in a figure. 7.G.5
6. Solve real-world and mathematical problems involving area, volume and surface area of two- and three-dimensional objects composed of triangles, quadrilaterals, polygons, cubes, and right prisms. 7.G.6

CHAPTER 5 OVERVIEW:

Chapter 5 builds on proportional relationships studied in chapter 4 and extends those ideas to scaling and the affects of scaling. The chapter starts by expiring conditions under which one can construct triangles and when conditions establish unique triangles. From there, students move in section 2 to scaling objects and exploring how scaling a side of an object affects the perimeter and area measures. Section 3 helps students understand that all circles are scaled versions of one another and how that fact allows us to connect the diameter of a circle to its circumference and area. Finally in section 4 students use angle relationships to find missing angles.

VOCABULARY: acute triangle, angle, congruent, corresponding parts, equilateral triangle, included angle, included side, isosceles triangle, obtuse triangle, right triangle, scalene triangle, triangle inequality theorem.

CONNECTIONS TO CONTENT:

Prior Knowledge: In elementary school students found the area of rectangles and triangles. They measured and classified angles and drew angles with a given measure. Though students learned about circles informally, haven’t learned how to find circumference and area.

Future Knowledge: The term “similarity” is formally defined in the 8th grade. In 7th grade we will say “same shape”. In 8th grade students will justify that the angles in a triangle add to 180° and will extend that knowledge to exterior angles and interior angles of other polygons. In 8th grade students will extend their understanding of circles to surface area and volumes of 3-D figures with circular faces. In 9th grade students will formalize the triangle congruence theorems (SSS, SAS, AAS, ASA) and use them to prove facts about other polygons. In 8th grade students will expand upon “same shape” (scaling) and extend that idea to dilation of right triangles and then to the slopes of lines. In 10th grade students will formalize dilation with a given scale factor from a given point as a non-rigid transformation (this will be when the term “similarity” will be defined) and will solve problems with similar figures. The understanding of how the parts of triangles come together to form its shape will be deepened in 8th grade when they learn the Pythagorean Theorem, and in 11th grade when they learn the Law of Sines and Law of Cosines.
### MATHEMATICAL PRACTICE STANDARDS (emphasized):

<table>
<thead>
<tr>
<th>Make sense of problems and persevere in solving them.</th>
<th>Students will analyze pairs of images to determine if they are exactly the same, entirely different or if they are the same shape but different sizes. With this information they will persevere in solving problems.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reason abstractly and quantitatively.</td>
<td>Students will find scale factors between objects and use them to find missing sides. They will also note that proportionality exists between two sides of the same object. Students should move fluidly from ( \frac{a}{b} = \frac{c}{d} \Rightarrow \frac{a}{c} = \frac{b}{d} ), etc. and understand why all these proportions are equivalent. Further, students should fluidly transition between proportionality and scale factor. E.G. If ( \triangle ABC : \triangle DEF ) is 2:3 then the scale factor that takes ( \triangle ABC ) to ( \triangle DEF ) is 3/2.</td>
</tr>
<tr>
<td>Construct viable arguments and critique the reasoning of others.</td>
<td>Students should be able to construct a viable argument for why two objects are scale versions of each other AND how to construct scale versions of a given object. Further, students should be able to explain why, for example, if the scale between two objects is 5:3 then a length of 20 on the first object becomes 12 on the new object by using pictures, words and abstract representations.</td>
</tr>
<tr>
<td>Model with mathematics.</td>
<td>Students should be able to create a model (table of values, bar model, number line, etc.) to justify finding proportional values. Additionally, students should be able to start with a model for a proportional relationship and then write and solve a mathematical statement to find missing values.</td>
</tr>
<tr>
<td>Attend to precision</td>
<td>Students should attend to units throughout. For example, if a scale drawing is 1mm = 3 miles, students should attend to units when converting from 4mm to 12 miles. Students should also carefully attend to parallel relationships: for example for two triangles with the smaller triangle having sides ( a, b, c ) and a larger triangle that is the same shape but different size with corresponding sides ( d, e, f ), the proportion ( \frac{a}{d} = \frac{b}{e} ) is equivalent to ( \frac{a}{b} = \frac{d}{e} ) but sets up relationships in a different manner.</td>
</tr>
<tr>
<td>Look for and make use of structure</td>
<td>Students will link concepts of concrete representations of proportionality (bar models, graphs, table of values, etc.) to abstract representations. For example, if a length 20 is to be scaled down by a factor of 5:3 one can think of it as something times (5/3) is 20 OR 20 divided by 5 taken 3 times.</td>
</tr>
<tr>
<td>Use appropriate tools strategically.</td>
<td>By this point, students should set up proportions using numeric expressions and equations, though some may still prefer to use bar models. Calculators may be used as a tool to divide or multiply, but students should be encouraged to use mental math strategies wherever possible. Scaling with graph paper is also a good tool at this stage.</td>
</tr>
<tr>
<td>Look for and express regularity in repeated reasoning</td>
<td>Students should connect scale to repeated reasoning. For example if the scale is 1:3 than each length of the shorter object will be multiplied by 3 to find the length of the larger scaled object; then to reverse the process, one would divide by three.</td>
</tr>
</tbody>
</table>
Cartoon characters are supposed to be illustrated versions of human beings. In a way, we could think about a cartoon character as a scale drawing of a human.

What if Wreck-it Ralph was a scale drawing of you!? If you were Wreck-it Ralph but still at your current height, how tall would your head be?

How big would your hands be?

How long would your legs be?

Students will set up proportions

Wreck-it Ralph to Student

\[
\frac{\text{Wreck-it Ralph Head height}}{\text{Body height}} = \frac{\text{Student Head height}}{\text{Body height}}
\]
5.0a Chapter Project: Constructing Scale Drawings 1

Task: Making a scale drawing of the top of your desk

- Use measuring tools and scissors to cut a piece of letter-sized plain paper or graph paper to be a scale model of the top of your desk.
- Write the scale on the corner of the paper.
- Place at least 3 items on your desk. For example, a pencil, eraser, book, soda can, cell phone, etc.
- Fill in the table of values below with measurements or calculations. You can choose what to measure for the five blank rows. The blanks in the column headings are to write what units you measured in (cm, inches, mm, units of graph paper, etc.)

<table>
<thead>
<tr>
<th>Item measured</th>
<th>Real measurement is</th>
<th>Measurement in scale drawing is</th>
</tr>
</thead>
<tbody>
<tr>
<td>A) Short side of top of desk</td>
<td></td>
<td></td>
</tr>
<tr>
<td>B) Long side of top of desk</td>
<td></td>
<td></td>
</tr>
<tr>
<td>C)</td>
<td></td>
<td></td>
</tr>
<tr>

<tr>
<td>E)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>F)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>G)</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

- Use measuring tools to draw your three items, to scale and in the same position as they are on your desk, on your scale drawing.
- Graph the information from your table on the grid on the next page, labeling each point with the letter A-G from the row of the table. Be sure to label the axes.
5.0a Chapter Project: Constructing Scale Drawings 2

Task: Making a scale drawing as a class. Choose one of the images below and make a scale drawing.

Below is an image of an ant (Nylanderia Pubens Worker ant) and a common house fly (Diptera).
- Use measuring tools to make a scale drawing of either the ant or fly picture below.
- Determine your scale.
5.0b Review: Angle Classification and Using a Protractor

Review Angles: For each angle below, a) use a protractor to find the measurement in degrees and b) write its classification (acute, obtuse, right or straight.)

<table>
<thead>
<tr>

Section 5.1 Constructing Triangles from Given Conditions

Section Overview:

In this section, students discover the conditions that must be met to construct a triangle. Reflecting the core, the approach is inductive. By constructing triangles students will note that the sum of the two shorter lengths of a triangle must always be greater than the longest side of the triangle and that the sum of the angles of a triangle is always 180 degrees (see the mathematical foundation for a discussion of these ideas.) They then explore the conditions for creating a unique triangle: three side lengths, two sides lengths and the included angle, and two angles and a side length—whether or not the side is included. This approach of explore, draw conclusions, and then seek the logical structure of those conclusions is integral to the new core. It is also the way science is done. In later grades students will more formally understand concepts developed here.

In 7th grade, students are to learn about “scaling.” The concepts in this section are foundational to scaling and then lead to proportional relations of objects that have the same “shape” in section 5.2. In 8th grade, students will extend the idea of scaling to dilation and then in Secondary I to similarity. The word “similar” may naturally come up in these discussions; however, it is best to stay with an intuitive understanding. A definition based on dilations will be floated in eighth grade, but will not be fully studied and exploited until 10th grade. In this section emphasis should be made on conditions necessary to create triangles and that conditions are related to knowing sides and angles.

Concepts and Skills to be Mastered (from standards)

Geometry Standard 2: Draw (freehand, with ruler and protractor, and with technology) geometric shapes with given conditions. Focus on constructing triangles from three measures of angles or sides, noticing when the conditions determine a unique triangle, more than one triangle, or no triangle. 7.G.2

Geometry Standard 6: Solve real-world and mathematical problems involving area, volume and surface area of two- and three-dimensional objects composed of triangles, quadrilaterals, polygons, cubes, and right prisms. 7.G.6

1. Given specific criteria, construct a triangle and know if it’s a unique triangle
2. Understand and explain the side length requirements of a triangle.
3. Understand and explain the angle and side requirements for constructing a unique triangle.
4. Know the angle measure requirements of a triangle. (Triangle Angle Sum Theorem)
5.1a Class Activity: Triangles and Labels—What’s Possible and Why?

Review Triangle: Write a description and sketch at least one example for the following terms: In elementary school, students learned these terms. Remind students that triangles are classified by angle measure and/or side length. Also, recall that all equilateral triangles are isosceles.

a. Acute triangle: All acute angles.

b. Obtuse triangle: One obtuse angle

c. Right triangle: One right angle

d. Equilateral triangle: All sides the same length

e. Isosceles triangle: At least two sides are the same length

f. Scalene triangle: Each side a different length

Activity: The Engineer’s Triangle: How many different triangles can an engineer make out of an 18 unit beam?

You’re an engineer and you need to build triangles out of 18 foot beams. How many different triangles can you make with an 18 foot beam? What do you notice about the sides of different triangles? What do you notice about the angles of different triangles?

In groups of 2-4, cut out several “18 foot beams.” Your group’s task is to make different triangles with your “beams.” For each triangle you construct, use the table below to classify it by angles and sides.

Be careful to line up the exact corners of the strips, like this: NOT at the center, like this:
GROUP RECORDING SHEET

For each triangle you construct: 1) record the length of each side, 2) the measure of each angle, 3) classify by angle and 4) classify by side. Pay attention to patterns. If you discover a pattern, write it down your conjecture.

<table>
<thead>

</tbody>
</table>
Instructions: Cut along the dotted lines to get strips 18 units long. Each unit represents one foot. For each trial, one member of your group will cut the strip into three pieces for the three side lengths of a possible triangle. Tape the triangle down when you’ve constructed it to help make the angle measuring easier.

Review: Using a protractor to find the measure of the angle.

Use the inside row, since this an obtuse angle. Thus, the angle is 100°, not 80°.
1. Is there more than one way to put together a triangle with three specific lengths?  
   No. Help students see that 3 known sides always create a unique triangle (when a triangle is actually created). This is the first time the word “unique” will likely come up. You should take time to explore the triangle. Note that regardless of the triangle’s orientation, the same triangle is always created. In 8th grade this will be explored further.

2. What pattern do you see involving the sides of the triangle? The sum of the two shorter sides of the triangle must be greater than the longest side in order for a triangle of area greater than 0 to be formed. Encourage students to support their conjectures. Push students to reason why the sum of the two shorter sides cannot equal the longer side. **READ THE MATHEMATICAL FOUNDATION FOR FURTHER DISCUSSION OF THIS POINT.** We’ve merely observed through experimentation that it’s true. To “prove” it’s true, we need to construct a sound argument. Note that when students study trig ratios, they will work with triangles where the sum of the two shorter sides is equal to that of the longest (hypotenuse) e.g. $\sin 0 = 0$.

3. What pattern do you see involving the angles of the triangle? The sum of the angles of a triangle equal 180°.

4. For each group of three side lengths in inches, determine whether a triangle is possible. Write yes or no, and justify your answer.
   a. $14, 15\frac{1}{2}, 2$ Yes  
   b. $1, 1, 1$ Yes, is equilateral  
   c. $7, 7, 17$ No, the sum of the two shorter sides is not as long as 3rd side.  
   d. $3, 9, 4$ No, the sum of the two shorter sides is not as long as 3rd side.  
   e. $6\frac{1}{3}, 5, 4$ Yes  
   f. $3, 2, 1$ No

5. If two side lengths of a triangle are 5 cm and 7 cm, what is the smallest possible integer length of the third side? 3 cm. If we did not restrict to integers, anything larger than 2 cm would work. Explore this idea with students. Would 2.5cm, 2.1cm, 2.01cm work? etc.…

Students are using repeated reasoning to answer questions.

6. If two side lengths of a triangle are 5 cm and 7 cm, what is the largest possible integer length of the third side? 11 cm—note that at 12 the other two sides would fall flat so the largest INTEGER value is 11. Again, take time to explore 11.5, 11.9, 11.99, etc.
If students do not have access to a protractor at home, you may copy these images of protractors on a transparency, cut them out, and give to students.
Spiral Review

1. Simplify $-27.3 + 6.2 = -21.1$

2. Find 45% of 320 without a calculator 144

3. Evaluate $-3x + 1.4$ for $x = -3$ $-7.6$

4. Kim, Laurel, and Maddy are playing golf. Kim ends with a score of $-8$. Laurel’s score is $-4$. Maddy scores $+5$. What is the difference between the scores of Maddy and Kim? $5 - -8 = 13$, Maddy had 13 more strokes than Kim

5. The temperature increased 2º per hour for seven hours. How many degrees did the temperature raise after seven hours? $7 \times 2 = 14$ so 14 degrees.
5.1a Homework: Triangle Practice

1. Explain what you know about the lengths of the sides of a triangle (the triangle inequality theorem.) The sum of the two shorter sides of a triangle must be greater than the length of the longest side.

For #2-7, (a) Carefully copy the triangle using a ruler and protractor, technology, or other means. Label the side lengths and angle measures for your new triangle. For side length units, use either centimeters or inches. (b) Write an inequality that shows that the triangle inequality holds. (b) Classify the triangle as equilateral, isosceles, or scalene by examining the side lengths. (d) Classify the triangle as right, obtuse, or acute by examining the angle measures.

2. 3
   \[ 40^\circ \quad 113^\circ \quad 4 \]
   \[ 6 \quad 27^\circ \]

3. \[ 5 \quad 29^\circ \quad 3 \]
   \[ 5 \quad 122^\circ \quad 29^\circ \]

4. \[ 3 \]
   \[ 4 \quad 60^\circ \quad 4 \]
   \[ 60^\circ \quad 4 \]

5. \[ 22^\circ \]
   \[ 13 \]
   \[ 12 \]
   \[ 68^\circ \quad 90^\circ \]

6 < 4 + 3 or 4 < 6 + 3 or 3 < 6 + 4

Scalene

Obtuse
6. \[ \begin{align*}
7 \quad 32^\circ \\
6 \\
\underline{65^\circ} \\
4
\end{align*} \]

7. \[ \begin{align*}
7 \quad 45^\circ \\
5 \\
\underline{45^\circ} \\
7
\end{align*} \]

**True or false.** Explain your reasoning—if false, give a counter example.

8. An acute triangle has three sides that are all different lengths.
   
   **False, look for a counter example such as an equilateral triangle.**

9. A scalene triangle can be an acute triangle as well.

10. An isosceles triangle can also be a right triangle.
    
    **True - see #7 above.**

11. If two angles in a triangle are 40° and 35°, the triangle must be acute.

12. An obtuse triangle can have multiple obtuse angles.

13. A scalene triangle has three angles less than 90 degrees.
    
    **False, a triangle can be obtuse and scalene at the same time – see #2 above.**

14. A triangle with a 100° angle must be an obtuse triangle.

15. The angles of an equilateral triangle are also equal in measure.
16. Write whether the three given side lengths can form a triangle. If not, draw a sketch showing why it doesn’t work.
   a. 8, 1, 8  
      Yes
   b. 3, 3, 3  
   c. 1, 4, 10  
      No
   d. $1 \frac{1}{2}, 5, 3 \frac{1}{2}$
   e. 15, 8, 9  
   f. 2, 2, 15
   g. 4, 3, 6.9  
      Yes
   h. $\frac{1}{3}, \frac{1}{3}, \frac{1}{3}$

17. Anna used the scale on a map to calculate the distances “as the crow flies” (meaning the perfectly straight distance) from three points in Central America and the Caribbean islands, marked on the map to the right.
   a. According to Anna, how far is it from Jamaica to Panama if you don’t go through Honduras?  
      700 miles
   b. According to Anna, how far is it from Jamaica to Panama if you do go through Honduras?  
      600 miles
   c. Another way of stating the triangle inequality theorem is “the shortest distance between two points is a straight line.” Explain why Anna must have made a mistake in her calculations. Her calculations show that the shorter distance is not the straight line.
5.1b Class Activity: Building Triangles Given Three Measurements

Preparation for task: included angles.

1. Circle all the triangles with side lengths 8 and 5 and an *included angle* of 32°.

![Triangle with side lengths 8 and 5 and an included angle of 32°]

2. Circle all the triangles with side lengths 4 and 3, with a *non-included angle* of 50° adjacent to the side with length 3.

![Triangles with side lengths 4 and 3, and a non-included angle of 50°]

3. Circle all the triangles with two angles 90° and 28° with an *included side* of 6 units.

![Triangles with two angles 90° and 28°, and an included side of 6 units]

**Discussion questions:** What if you only have three pieces of information about a triangle, like two angle measurements and one side length? Is it possible to create more than one unique triangle with that information?
Materials: GeoGebra and 5.2 GeoGebra files. (The GeoGebra links are on the teacher and student support sites at UtahmiddleSchoolMath.org). You may also do this activity with concrete manipulatives.

Instructions: Open the file. Read the criteria that your triangle must satisfy. Drag the pieces to carefully form a triangle with the information required. If no triangle is possible, explain why. If only one triangle is possible, draw it and measure the remaining sides and angles using the tools in the program. If there is more than one way to make the triangle, draw both triangles.

<table>
<thead>
<tr>
<th>Trial #</th>
<th>Criteria</th>
<th>How many different triangles?</th>
<th>How many triangles?</th>
</tr>
</thead>
<tbody>
<tr>
<td>Trial #1: SSS</td>
<td>Draw the triangle(s), or write why no triangle is possible.</td>
<td>One possible triangle.</td>
<td></td>
</tr>
<tr>
<td>Trial #2: SAS</td>
<td>Draw the triangle(s), or write why no triangle is possible.</td>
<td>One possible triangle.</td>
<td></td>
</tr>
<tr>
<td>Trial #3: ASA</td>
<td>Draw the triangle(s), or write why no triangle is possible.</td>
<td>One possible triangle.</td>
<td></td>
</tr>
<tr>
<td>Trial #4: SSA</td>
<td>Draw the triangle(s), or write why no triangle is possible. More than one. Note that given two sides and an angle that is not included there may be up to two triangles possible, but never more than 2.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Trial #5: AAS</td>
<td>Draw the triangle(s), or write why no triangle is possible.</td>
<td>One possible.</td>
<td></td>
</tr>
</tbody>
</table>

Discussion notes: Notice that all the above examples included a side. Ask students about AAA (and then by extension AA.) No, three angles do not guarantee we will create a unique triangle—though all triangles created will have the same shape (similar.) Note too that one only needs 2 angles for the same shape; once you have two angles, the third is automatically determined.
Spiral Review

1. \(-8 = -3m + 10\)  \(m = 6\)

2. \(-12 = 3x\)  \(x = -4\)

3. Write \(\frac{3}{5}\) as a percent and decimal.  \(60\%, 0.6\)

4. Show how to simplify the following expression with a number line  \(-6 + (-3) = -9\)

5. Kurt earned $550 over the summer. If he put 70% of his earnings into his savings, how much money did he have left over?

\[550(1 - 0.70) = 165\]  \(\text{or}\)  \(550 - 385 = 165\)
5.1b Homework: Building Triangles Given Three Measurements

1. Use the grid below to draw and label $\triangle ABC$ with the length of $\overline{AB}$ 5 units, the length of $\overline{BC}$ 7 units, and the measure of $\angle ABC = 90^\circ$.

   ![Diagram of a right triangle]

2. Is $\angle ABC$ the included angle to the given sides? Explain.

3. What is the area of the triangle in #2? Justify your answer.

4. Will all your classmates who draw a triangle like #2 get a triangle with the same area? Explain.

5. Which triangle(s) has two sides 5 and 8 units, and a non-included angle of $20^\circ$ adjacent to the side of length 8?

   ![Diagram of two triangles]

6. Are the two triangles in #5 exactly the same in size and shape?
   
   No, because $\angle ABC$ is not the same in both triangles.
For #7-13, decide whether there are 0, 1, or more than one possible triangles with the given conditions. Use either a ruler and protractor, graph paper strips and protractor, or GeoGebra to draw the triangles.

</tbody>
</table>
5.1c Honors Extension: Sum of the Angles of a Polygon Exploration

Activity: Cut out 5 *different* triangles, quadrilaterals, pentagons, and hexagons (all convex). Mark the angles and then tape them together. Use a protractor to find the measure of the sum of the angles and fill in the table.

<table>
<thead>
<tr>
<th>POLYGON</th>
<th>Number of Angles</th>
<th>Sum of Angles</th>
</tr>
</thead>
<tbody>
<tr>
<td>Triangle</td>
<td>3</td>
<td>180°</td>
</tr>
</tbody>
</table>

Try this activity before you do it with students. You will notice that when you tape together the angles of a triangle, you will form a straight line. If you tape together the angles of a quadrilateral, the angles will sum to 360 degrees (some students will say “a circle.”)

To do a pentagon, you’re going to have to “overlap.” E.G. As you join your angles, you’ll go past 360 to 540 degrees.

1) What pattern do you notice?

   Allow students to explore. They should see that there is a pattern with 180 degrees. Some students may notice that odd number sided polygons end in “lines” whereas even sided polygons end in “circles.” There is no need to push for 180(n-2) as a formula, though you want them to articulate that concept in words and then use it as they check an octagon.

2) What do you expect the sum of the angles of an OCTAGON will be?
3) Cut out a convex octagon and test your conjecture.

4) Cut out a triangle and quadrilateral. Trace out the triangle on to a piece of grid paper. After you have traced it, rip the corners off and try to construct as many new triangles as you can with the original angles. Do the same with the quadrilateral. What do you notice?

Students will need grid paper for this activity. They should note that for a triangle, they can construct infinitely many triangles with the original angles and each of the new triangles will be the same shape but different sizes from the original. However, the angles of the quadrilateral can create quadrilaterals that are the same shape but different sizes of the original OR they might create quadrilaterals that are not the same shape (for example, four right angles can create infinitely many squares; or they can create infinitely many rectangles.) The discussion will lead to ideas that will be developed in #5.

5) Predict the sum of the angles of a 10-agon.
Spiral Review

1. \(5 \times (-11) = -55\)

2. Without a calculator, what percent of 80 is 60? \(75\%\)

3. Find the following with or without a model:
   \[
   26 + (-26) = 0 \text{ (additive inverse)}
   \]
   \[
   \frac{1}{6} + \frac{3}{7} = \frac{7/42 + 18/42}{25/42}
   \]

4. Order the numbers from least to greatest.
   
   \(-2.15, \frac{17}{7}, 2.7, 2.105\)

5. Given the following table, find the indicated unit rate:

<table>
<thead>

</tbody>
</table>
Sample Problems for Section 5.1

1. Given the following criteria, construct a triangle:
   a. Draw and label $\triangle ABC$ with the length of $AB$ 5 units, the length of $BC$ 7 units, and the length of $CA$ 10 units.
   b. Draw and label $\triangle ABC$ with the measure of $CAB = 40^\circ$, the measure of $BCA = 50^\circ$, and the measure of $\angle ABC = 90^\circ$.
   c. Draw and label $\triangle ABC$ with the measure of $CAB = 60^\circ$, the length of $CA$ 4 units, and the length of $BA$ 6 units.

2. Determine if the following side lengths will make a triangle. Explain why or why not.
   a. 2, 5, 7
   b. 33, 93.2, 70
   c. 1, 2.7, 7

3. Determine if the given information will make a unique triangle. Explain why or why not.
   a. Side lengths 3 and 5 and an included angle of $67^\circ$
   b. Angles 73$^\circ$, 7$^\circ$, 100$^\circ$
   c. Angles 80$^\circ$ and 25$^\circ$ and included side of 12

4. Determine if the given angles will make a triangle. Explain why or why not.
   a. Angles 25$^\circ$, 70$^\circ$, 95$^\circ$
   b. Angles 30$^\circ$, 40$^\circ$, 20$^\circ$
Section 5.2: Scale Drawings

Section Overview: The central idea of this section is scale and its relationship to ratio and proportion. Students will use ideas about ratio, proportion, and scale to: a) change the size of an image and b) determine if two images are scaled versions of each other.

By the end of this section, each student should understand that we could change the scale of an object to suit our needs. For example, we can make a map where 1 inch equals one mile; lie out a floor plan where 2 feet equals 1.4 cm from a diagram; or draw a large version of an ant where 3 centimeters equals 1 mm. In each of these situations, the “shape characteristics” of the object remain the same, what has changed is size. Objects can be scaled up or scale down. Through explorations of scaling exercises, students will see that all lengths of the given object are changed by the same factor in the scaled representation and this factor is called the scale factor.

The term “similar” will not be defined in 7th grade; here students continue to develop an intuitive understanding of “the same shape,” so that the concept of similarity (introduced in 8th grade) is natural. Throughout this section students should clearly distinguish between two objects that are of the same shape and dimension and objects that are scaled versions of each other. In particular students will come to understand that two polygonal figures that are scaled versions of each other have equal angles and corresponding sides in a ratio of $a:b$ where $a \neq b$. Students should also distinguish between saying the ratio of object A to object B is $a:b$ while the scale factor from A to B is $b/a$. This idea links ratio and proportional thinking to scaling.

Students will learn to find the scale factor from one object to the other from diagrams, values and/or proportion information. Students should be able to fluidly go from a smaller object to a larger scaled version of the object or from a larger object to a smaller scaled version giving either or both the proportional constant and/or the scale factor.

In this section and through the chapter, abstract procedures will be emphasized for finding scale factors and/or missing lengths, however some students may prefer to continue to use bar models. Bar model strategies will become increasingly more cumbersome, so it will be important to help students transition to more efficient procedures. This can be done by helping students connect concrete models (i.e. bar/tape models) to the algorithmic procedure as was done in Chapter 4.

Concepts and Skills to be Mastered (from standards)

Geometry Standard 1: Solve problems involving scale drawings of geometric figures, including computing actual lengths and areas from a scale drawing and reproducing a scale drawing at a different scale. 7.G.1

Geometry Standard 6: Solve real-world and mathematical problems involving area, volume and surface area of two- and three-dimensional objects composed of triangles, quadrilaterals, polygons, cubes, and right prisms. 7.G.6

1. Draw a scaled version of a triangle, other polygon, or other object given lengths.
2. Find a measure of a scaled object given the scale factor and measure from the original.
3. Find the scale factor between two objects that are the same shape but different sizes/proportional.
4. Use proportional reasoning in explaining and finding missing sides of objects that are the same shape but different sizes.
5. Find the scale factors for perimeter or area for proportional objects.
5.2a Classwork: Comparing the Perimeter and Area of Rectangles

Activity 1: Below is an image of a rectangle, which are 4 units by 6 units. On the first grid provided, draw a rectangle with sides lengths TWICE as long as this image (label the new vertices E, F, G, H) and on the other grid draw a rectangle with side lengths HALF as long as this image (label the new vertices I, J, K, L.)

a) Describe the method you used to double the length of each side. Students will use a variety of methods. Highlight methods that involve “slope thinking”, e.g. a student might say, “to get from A to C, you go up 4 and right 2, so to double that length, I went up 8 and right 4.” Students may just say, “AB is 4 units, so the new side must be 8.”

b) Describe the method you used to make each side have a length half the length of the original.

c) Do you think the area of the new rectangles changes at the same rate as the sides? Explain. Area is squared when side lengths are doubled.

Sides that are twice as long as the image above. Sides that are half as long as the image above.

Fill out the missing blanks in the chart below:

<table>
<thead>
<tr>
<th>Rectangle</th>
<th>Dimensions</th>
<th>Perimeter</th>
<th>Area</th>
<th>Change from original rectangle ABCD</th>
</tr>
</thead>
<tbody>
<tr>
<td>ABDC</td>
<td>4 × 6</td>
<td>20</td>
<td>24</td>
<td>Same</td>
</tr>
<tr>
<td>EFGH</td>
<td>8 × 12</td>
<td>40</td>
<td>96</td>
<td>Dimensions double, perimeter doubled, area quadrupled (times 4)</td>
</tr>
<tr>
<td>IJKL</td>
<td>2 × 3</td>
<td>10</td>
<td>6</td>
<td>Dimensions half, perimeter half, area divided by 4</td>
</tr>
</tbody>
</table>

Activity 2: Below is an image of a rectangle which is 3 units by 5 units. On the first grid provided, draw a rectangle with sides lengths TWICE as long as this image (label the new vertices Q, R, S, T) and on the other grid draw a rectangle with side lengths HALF as long as this image (label the new vertices U, V, W, X).

Sides that are twice as long as the image above.  

Sides that are half as long as the image above.

Fill in the missing blanks in the chart below:

<table>
<thead>
<tr>
<th>Rectangle</th>
<th>Dimensions</th>
<th>Perimeter</th>
<th>Area</th>
<th>Change from original rectangle ABCD</th>
</tr>
</thead>
<tbody>
<tr>
<td>MNOP</td>
<td>3 × 5</td>
<td>16</td>
<td>15</td>
<td>Same</td>
</tr>
<tr>
<td>QRST</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>UVWX</td>
<td>1.5 × 2.5</td>
<td>4</td>
<td>3.75 or 15/4</td>
<td>Dimensions half, perimeter half, area divided by 4</td>
</tr>
</tbody>
</table>

Discuss that if lengths are doubled, the new area changes by $2^2$ times the original (old) area; if lengths are divided by 2 (multiplied by $(1/2)$), the new area is $(1/2)^2$ the original (old) area.
Spiral Review

1. What are triangles with all sides the same length called? __Equilateral triangles__

2. Katherine is visiting patients in a hospital. She visits 18 patients in 6 hours. At that rate, how many patients will she visit in 9 hours?

<table>
<thead>
<tr>
<th>hours</th>
<th>Patients visited</th>
</tr>
</thead>
<tbody>
<tr>
<td>6</td>
<td>18</td>
</tr>
<tr>
<td>9</td>
<td>27</td>
</tr>
</tbody>
</table>

3. What is an obtuse angle? An angle whose measure is 90 degrees < angle measure < 180 degrees

4. The price for two bottles of ketchup are given below:

   A 20 oz. bottle of DELIGHT ketchup is 98¢ at the grocery store. A 38 oz. bottle of SQUEEZE ketchup is $1.99 at the same grocery store.

   a) find the unit rate for each product

      DELIGHT is __$.049__ per ounce SQUEEZE is __$.052__ per ounce

   b) What conclusions can you draw from this information?

      DELIGHT is the least expensive of the two.
## 5.2a Homework: Comparing the Perimeter and Area of Rectangles

Below is a table that describes the dimensions, perimeter, area and change of side lengths for a rectangle that’s scaled in different ways. In the first row you find that the 5x20 rectangle has a perimeter of 50, area of 100; there is no change in side length here because it’s the original rectangle. In the next row the dimensions become 10x40 giving it a perimeter of 100 and area of 400; the side length change is twice the original. Examine the other rows to understand what’s happening to the rectangle. Then graph the relationship between the perimeter (x axis) and area (y axis) on the graph below. Describe the pattern you notice.

<table>
<thead>
<tr>
<th>Dimensions</th>
<th>Perimeter</th>
<th>Area</th>
<th>Change of side lengths from original rectangle</th>
</tr>
</thead>
<tbody>
<tr>
<td>5 by 20</td>
<td>50</td>
<td>100</td>
<td>Same</td>
</tr>
<tr>
<td>10 by 40</td>
<td>100</td>
<td>400</td>
<td>Twice</td>
</tr>
<tr>
<td>5/2 by 10</td>
<td>25</td>
<td>25</td>
<td>Half</td>
</tr>
<tr>
<td>15 by 60</td>
<td>150</td>
<td>900</td>
<td>Three times</td>
</tr>
<tr>
<td>5/3 by 20/3</td>
<td>16.67</td>
<td>11.11</td>
<td>One third</td>
</tr>
<tr>
<td>20 by 80</td>
<td>200</td>
<td>1600</td>
<td>Four times</td>
</tr>
</tbody>
</table>

Students should notice that the relationship is not linear. Other ideas may also surface.
5.2b Classwork: Scaling Triangles

Activity 1: Below is an image of a triangle. On the first grid provided, draw a triangle with sides lengths TWICE as long as this image (label the new vertices D, E, F) and on the other grid draw a triangle with side lengths HALF as long as this image (label the new vertices G, H, I.)

- a) Describe the method you used to double the length of each side. Students will use a variety of methods. Highlight methods that involve “slope thinking”; e.g. a student might say, “to get from A to C, you go up 4 and right 2, so to double that length, I went up 8 and right 4.”

- b) Describe the method you used to make each side have a length half the length of the original.

- c) Do you think the angles of the new triangles are the same or different than the original triangle? Explain. Angles are preserved.

Discuss with students that as with rectangles, when the lengths of sides are doubled, the new perimeter doubles, and the new area is quadruple the original area; when lengths of sides are multiplied by \( \frac{1}{2} \) the new perimeter will be \( \frac{1}{2} \) the original and the new area will be \( \left(\frac{1}{2}\right)^2 \) the original.

Eventually you want students to understand that when sides are scaled by a factor of \( a \), the new perimeter is \( a \) times the original perimeter and the new area is \( a^2 \) time the original area.
**Activity 2:** Exploring the relationship between triangles that have the same angle measures but side lengths that are different.

Which sides and angles correspond to each other? List corresponding angles and sides:

- \( \angle ABC \) (48°) and \( \angle PQR \) (48°)
- \( \angle BCA \) (117°) and \( \angle QRP \) (117°)
- \( \angle CAB \) (15°) and \( \angle RPQ \) (15°)
- \( \overline{AB} \) (7) and \( \overline{PQ} \) (21)
- \( \overline{BC} \) (2) and \( \overline{QR} \) (6)
- \( \overline{CA} \) (6) and \( \overline{RP} \) (18)

a) Describe how these triangles are similar and different:

b) What do you notice about the lengths of the sides of the two triangles? Corresponding sides have the same ratio. The ratio of the sides is 1:3 little:big. However, to find the length of a side on the larger triangle, one multiplies the corresponding side of the smaller triangle by 3. *Said another way, the ratio of little:big is 1:3 but the scale factor from the little to big is 3.* This is an important point, be sure to emphasize it.

Look back at Activity 1 in this section. Write the ratio of the original triangle to the triangle with side lengths that are twice the original and then write the ratio of the original triangle to the triangle with side lengths that are half as long as the original.

Clarify for students the difference between “ratio” and “scale factor,” e.g. in Activity 1 the ratio between the sides of original to twice the length is 1 : 2. However the scale factor is 2. In other words, one multiplies each length of the original by 2 to get the larger triangle. For the original:half the ratio is 1:1/2 but the scale factor is \( \frac{1}{2} \).
3. Find the ratios for the lengths of the given sides.

</table>

4. Some of the ratios above make comparisons of measurements in the same triangle. Other ratios make comparisons of measurements of corresponding parts of two different triangles. Put a star by the ratios that compare parts of two different triangles. What do you notice? a, b, c, d. The ratios are all the same.

5. Since the corresponding parts have the same ratio, there is a scale factor from $\triangle ABC$ to $\triangle PQR$. The scale factor is the number you would multiply a length in $\triangle ABC$ to get the corresponding length in $\triangle PQR$. What is the scale factor from $\triangle ABC$ to $\triangle PQR$? Explain how you arrived at your answer.

6. What is the scale factor from $\triangle PQR$ to $\triangle ABC$? $1/3$

7. What is the mathematical relationship between the scale factor of $\triangle PQR$ to $\triangle ABC$ and the scale factor of $\triangle ABC$ to $\triangle PQR$? They are reciprocals.

8. The scale factors from $\triangle ABC$ to $\triangle PQR$ is an enlarging scale factor, and the other is a reducing scale factor. What would be the scale factor to keep a figure the same size?

Discuss with students: You can set ratios of corresponding pairs of parts equal to solve for unknown lengths. As we did when writing proportions in chapter 4, make sure you make like comparisons. You can use comparisons of two parts of the same triangle, or comparisons of corresponding parts in different triangles, as long as you are consistent in order of the comparison of the two ratios.
9. Use a straight edge and protractor to construct \( \triangle ABC \) then construct a new triangle, \( \triangle DEF \), that is the same shape as \( \triangle ABC \), but the scale factor from \( \triangle ABC \) to \( \triangle DEF \) is 2. Help students notice that 2 is an \textit{enlarging} scale factor. The sides of the new triangle will be 6, 12.4 and 8.

![Triangle](image)

Discuss with students the notion of “unit.” In #9, the line segment from A to B can be thought of as a unit. That length, regardless of how one measures it (inches, centimeters, millimeters, etc.), needs to double for the new triangle because the scale factor is 2. Similar reasoning for the other two sides.

10. If the ratio of \( \triangle HIJ \) to \( \triangle DEF \) is \( \frac{4}{3} \), (see \( \triangle HIJ \) below), draw \( \triangle DEF \). Show the length of each of the sides.

![Triangle](image)

There are three ways a student might think about the relationship: 1) because the ratio is 4/3, we know the scale factor is \( \frac{3}{4} \) (the reciprocal.) So we multiply the length of each side of the original triangle by the scale factor \( \frac{3}{4} \) to get the length of the new triangle. Length of HI is 4, so for the new triangle it will be \( 4 \times \left( \frac{3}{4} \right) \) or 3. 2) Write a proportion equation: for HI original/new = \( \frac{4}{3} = \frac{4}{x} \); for IJ original/new = \( \frac{4}{3} = \frac{8}{x} \) and solve. 3) Each side of the original can be divided it into 4 equal parts and then take 3 for the new figure.

Also connect the idea of SAS—once we have the two sides and know that the included angle is 90 degrees, we can construct a unique triangle.

11. The ratio of \( \triangle ABC \) to \( \triangle DEF \) is 5:4. If \( \overline{BC} \) is 15, what is the length of \( \overline{EF} \)? You may need to draw a diagram.
12. The two triangles below are scaled versions of each other. Use a protractor to find the measure of each of the angles of the two triangles below.

13. What is the ratio of $\triangle ABC$ to $\triangle XYZ$? What is the scale factor that takes $\triangle ABC$ to $\triangle XYZ$?

   **Ratio is 2:3 and scale factor is 3/2**

14. Which of the following proportions would be valid for finding the length of $\overline{BC}$? Circle all that apply.
   
   a. $\frac{9.6}{6.4} = \frac{8.3}{BC}$
   b. $\frac{6.4}{BC} = \frac{8.3}{9.6}$
   c. $\frac{BC}{6.4} = \frac{8.3}{9.6}$
   d. $\frac{BC}{7.7} = \frac{8.3}{9.6}$

   a and c. Stress the importance of parallel structure when setting up proportions.

15. Write different proportions that could be used to solve for the length of $\overline{BC}$. Solve your proportion.

16. Write and solve a proportion to find the length of $\overline{XZ}$.

   $\overline{XZ} = 11.55$
Spiral Review

1. Suppose you were to flip a coin 3 times. What is the probability of getting heads all three times? \( \frac{1}{8} \)

2. Samantha has 120 bracelets. She sells \( \frac{2}{3} \) of the bracelets and then decides to donate 50% of the rest. How many bracelets does she still have?

3. Place each of the following integers on the number line below. Label each point:

\[ A = 4 \quad B = -4 \quad C = -15 \quad D = 7 \quad E = 18 \quad F = -19 \]

4. Write 0.672 as a percent. \( 67.2\% \)
5.2b Homework: Scaling Triangles

1. The measure of each of the sides of $\triangle DEF$ is given. Draw a $\triangle GHI$ that has side lengths that are three times as long as $\triangle DEF$

2. If the ratio of $\triangle BCD$ to $\triangle EFG$ is 3:5 and the length of $\overline{BC}$ is 6”, what is the length of $\overline{EF}$? Justify your answer.
For #3-4, the triangles given in each are proportional. Do the following: a) solve for the unknowns by using proportions and b) state the scale factor between the two triangles. Express all answers exactly. Figures are not necessarily drawn to scale. Show your work.

3. 

\[ x = 4 \]
\[ y = \frac{3}{2} \]
Scale factor is 3 (ratio is 1:3)

4. 

\[ x = \frac{5}{8} \]
\[ y = \frac{9}{16} \]
Scale factor is 3 (ratio is 1:3)
5.2c Class Activity: Solve Scale Drawing Problems, Create a Scale Drawing

1. Your sister wants a large poster version of a small drawing she made. She drew it on centimeter graph paper.

   a. What are the dimensions of her original picture as shown to the right?

      \[8 \text{ cm} \times 6 \text{ cm}\]

   b. She wants the poster version to have a height of at least 2 feet. What scale should she use so that her poster is 2 feet tall?

      \[
      \frac{6 \text{ cm}}{\text{Height of original}} : \frac{2 \text{ ft}}{\text{Height of large poster}}
      \]

   c. The side of a square in the original picture is 1 cm long. How long will the side of a square be in the final poster? \(4"\) (Since 1 square is \(1/6\) of the height of the image, it should be \(1/6\) the height (24") of poster.)

   d. What will be the dimensions of the final poster?

      \(2\frac{1}{2}'' \times 2'\) or 32 inches wide by 24 inches high

1. Hal used the scale 1 inch = 6 feet for his scale model of the new school building. The actual dimensions of the building are 30 feet (height), by 120 feet (width) by 180 feet (length). What are the dimensions of his scale model?

      \(5'' \times 20'' \times 30''\)

2. On a separate sheet of grid paper, create the creature below so that it is a 1:3 enlargement of the original model. Write your strategy for calculating lengths to the right of the picture.

   This will likely take about 10 minutes. Students may literally scale (for each unit of one on the original, they’ll count out 3 on the scaled version) as they draw, or they may compute lengths and then draw.
3. Ellie was drawing a map of her hometown using a scale of 1 centimeter to 8 meters.

   a. The actual distance between the post office and City Hall is 30 meters. What is the exact distance between those two places on Ellie's map?
      
      3.75 cm

   b. In her drawing, the distance from the post office to the library is 22 centimeters. What is the actual distance?
      
      176 m

4. Allen made a scale drawing of his rectangular classroom. He used the scale \( \frac{1}{2} \text{inch} = 4 \text{feet} \). His actual classroom has dimensions of 32 feet by 28 feet.

   a. What are the dimensions of his scale drawing of the classroom?
      
      4” x 3.5”

   b. The simplified unit ratio of classroom length : drawing length, written as a fraction, \( \frac{\text{classroom length}}{\text{drawing length}} \), is the scale factor for lengths. What is it?
      
      \( \frac{8 \text{ feet}}{1 \text{ inch}} \) or \( \frac{96}{1} \)

   c. The simplified unit ratio of classroom area : drawing area, written as a fraction, \( \frac{\text{classroom area}}{\text{drawing area}} \), is the scale factor for areas. What is it? 896 sq ft : 14 sq inches or 64 sq ft : 1 sq in. or
      
      \( \frac{896 \text{ square feet}}{14 \text{ square inches}} \) or \( \frac{64 \text{ square feet}}{1 \text{ square inch}} \) or \( \frac{9216}{1} \)

   d. What is the mathematical relationship between the scale factor for lengths and the scale factor for areas?
      
      The scale factor of the areas is the same as squaring the scale factor of the lengths.
5. Audrey wants to make a scale drawing of the stamp below. She makes a scale drawing where 1 cm in the drawing represents 3 cm on the stamp. Which of the following are true?
   a. The drawing will be \( \frac{1}{3} \) as wide as the stamp. **True**
   b. The stamp will be 3 times as tall as the drawing. **True**
   c. The area of the stamp will be 3 times as large as the drawing. **False**
   d. The area of the stamp will be 6 times as large as the drawing. **False**
   e. The area of the stamp will be 9 times as large as the drawing. **True**

6. The following images are taken from four different maps or scale drawings, each shows a different way of representing scale:

<table>
<thead>
<tr>
<th>Scale</th>
<th>Drawing</th>
<th>Real Size</th>
</tr>
</thead>
<tbody>
<tr>
<td>¼&quot; = 1 Foot</td>
<td></td>
<td>1 inch = 1 meter</td>
</tr>
<tr>
<td>2 miles</td>
<td></td>
<td>1 meter</td>
</tr>
<tr>
<td>1:10 (1 foot: 10 mm)</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Which scale represents a drawing that has shrunk the most from the original? Justify your answer. **The 2 mile one**
7. The scale of the drawing on the right is 1 unit = $\frac{1}{4}$ foot. Use the grid below to draw a new scale drawing where 1 unit = $\frac{1}{2}$ foot.

The grid below is purposely 4 times larger than the original to help illustrate the relationship.

Notice that the width of the deer’s head at its widest is four units. Because each unit in the original equals $\frac{1}{4}$ foot, thus the width is 1 foot. For the new scaled version, 1 unit = $\frac{1}{2}$ foot. To get a width of 1 foot, it will only need to be two units wide.
Spiral Review

1. Suppose you flip a coin 3 times; what is the probability that you get a heads at exactly two times?
   HHH, HHT, HTH, THH, TTT, TTH, THT, HTH  \[ \frac{3}{8} \]

2. For each group of three side lengths in inches, determine whether a triangle is possible. Write yes or no.
   Justify your answer.
   a. 14, 15 1/2, 2 Yes
   b. 1, 1, 1 Yes
   c. 3.2, 7.2, 2.3 No, the sum of the two shorter sides is less than that of the longer side

   -24.4

4. Use long division to show how you can convert this fraction to a decimal and then a percent:
   \[ \frac{4}{7} \]
   \[
   \begin{array}{r}
   4.571 \\
   \hline
   7 \mid 4.00 \\
   \hline
   50 \\
   \hline
   49 \\
   \hline
   10 \\
   \hline
   07
   \end{array}
   \]
   .571 or .57, 57%

5. Athena has $24 less than Bob. Represent how much money Athena has.
   If \( b \) is the amount of money Bob has. Then Athena has \( b - 24 \) dollars.
5.2c Homework: Solve Scale Drawing Problems, Create a Scale Drawing

1. On a map, Breanne measured the distance (as the crow flies) between Los Angeles, California and San Francisco, California at 2 inches. The scale on the map is \( \frac{1}{4} \text{ inch} = 43 \text{ miles} \). What is the actual straight-line distance between Los Angeles and San Francisco?

   **344 miles**

2. Janie made a 2.5 inch scale model of one of the tallest buildings in the world: Taipei 101. The scale for the model is \( \frac{1}{4} \text{ inch} = 167 \text{ feet} \). Find the actual height of Taipei 101.

3. What scale was used to enlarge the drawing below? How do you know?

![Drawing](image_url)
4. On the 0.25 inch grid below, create a scale drawing of a living room which is 9 meters by 6.25 meters. In the scale drawing include the following:
   a. Two windows on one of the walls. Each window is 1.25 meters wide.
   b. An entrance (1.5 meters wide) from the side opposite the windows.
   c. A sofa which is 2 meters long and 0.75 meters wide.
   c. Record the drawing scale below the grid.
The scale drawing of a house is shown. The scale is 1 unit : 2 feet. Any wall lines that are between units are exactly halfway.

1. The balcony off the bedroom has dimensions in the drawing of $7 \times 2$. Complete the table, including the appropriate units:

<table>
<thead>
<tr>
<th></th>
<th>Balcony length</th>
<th>Balcony width</th>
<th>Balcony area</th>
</tr>
</thead>
<tbody>
<tr>
<td>Drawing</td>
<td>7 units</td>
<td>2 units</td>
<td></td>
</tr>
<tr>
<td>Actual house</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

2. What is the scale factor to get from units in the drawing to feet in the house? **1 unit : 2 feet, so the scale factor is 2—one multiplies the units by 2 to find the length in feet.**

3. What is the scale factor to get from square units in the drawing to square feet in the house?

4. If the architect includes a bench on the balcony that has dimensions $2.5 \times 1$ units, what are the dimensions of the bench in the house? **5 ft \times 2 ft**
5. Complete the table for the bathroom, including the appropriate units:

<table>
<thead>
<tr>
<th></th>
<th>Bathroom length</th>
<th>Bathroom width</th>
<th>Bathroom area</th>
</tr>
</thead>
<tbody>
<tr>
<td>Drawing</td>
<td>5 units</td>
<td>5 units</td>
<td>25 square units</td>
</tr>
<tr>
<td>Actual house</td>
<td>10 feet</td>
<td>10 feet</td>
<td>100 square feet</td>
</tr>
</tbody>
</table>

6. What is the ratio of \[\frac{\text{area in house}}{\text{area in drawing}}\]? \(4:1\)

7. If the backyard in the drawing has an area of 150 square units, how big is the area of the actual backyard of the house?

8. If the walkway to the entryway is 6.5 units long in the drawing, how long is the walkway on the house?

9. Use the drawing to determine how wide each interior door in the house is.
   - 3 feet

10. Approximately how long is each bed in the house?

11. By counting the number of square units in the master bedroom in the drawing, calculate the area of the master bedroom in the house. Include the area taken up by furniture.
   - 174 square feet

12. Challenge: What is the total square footage of the house, including the balconies? Show your work, labeling the expressions for each step with what they represent in the house.
5.2d Homework: Scale Factors and Area

1. Mouse’s house is very small. His living room measures 2 feet by 4 feet. Draw his living room on the grid. Label the dimensions and the area.

2. Double-Dog’s living room dimensions are double Mouse’s living room. Draw his living room on the grid. Label the dimensions and the area.

3. Triple-Threat-Tiger’s living room is triple the dimensions of Double-Dog’s. Draw Tiger’s living room on the grid. Label the dimensions and the area.

4. Fill in the table below with the dimensions and areas of the living rooms from the sketches above.

<table>
<thead>
<tr>
<th>Homeowner</th>
<th>Living Room Dimensions (Length and Width)</th>
<th>Living Room Area</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mouse</td>
<td>2 feet by 4 feet</td>
<td>8 sq. feet</td>
</tr>
<tr>
<td>Double-Dog</td>
<td>4 feet by 8 feet</td>
<td>32 sq. feet</td>
</tr>
<tr>
<td>Triple-Threat-Tiger</td>
<td>12 feet by 24 feet</td>
<td>288 sq. feet</td>
</tr>
</tbody>
</table>

5. Compare measurements for Mouse and Double-Dog’s living rooms. Use scale factor in the comparison.
   a. the dimensions        b. the area
   Mouse:Double dog = 1:2   Mouse: Double dog = 1:4
   Scale factor is for length is 2 Scale factor for area is 4

   a. the dimensions        b. the area
   Double dog:Triple-Threat = 1:3 Double dog:Triple-Threat = 1:9
   Scale factor is for length is 3 Scale factor for area is 9

7. Compare Mouse and Triple-Threat-Tiger’s living rooms. Use scale factor in the comparison.
   a. the dimensions        b. the area
   Mouse :Triple-Threat = 1:6 Mouse:Triple-Threat = 1:36
   Scale factor is for length is 6 Scale factor for area is 36
8. Generalize a rule related to the scale factors of dimensions and area. You might use “if…., then….”

For example: “If the dimensions of an object are multiplied by _____, the area will be multiplied by _____.”

If the dimensions of an object are multiplied by \(x\), then the area will be multiplied by \(x^2\).

9. If the area of Mouse’s kitchen is 12 square feet, and the dimensions of Double-Dog’s kitchen are twice as big as the dimensions of Mouse’s, what will the area of Double-Dog’s kitchen be?

48 sq. feet

10. If the dimensions of Triple-Threat-Tiger’s kitchen are three times the dimensions of Double-Dog’s, what will the area of Triple-Threat-Tiger’s kitchen be?

432 sq. feet

11. If the area of Mouse’s bathroom is 5 square feet, the dimensions of Double-Dog’s bathroom are twice Mouse’s, and Triple-Tiger’s are three times Double-Dog’s, what will the area of Triple-Threat-Tiger’s bathroom be? Is there a shortcut?

180 sq. feet. Yes, multiply the two scale factors together: \(4 \times 6 = 36\)

12. Ms. Herrera decided to shrink a picture so that it would fit on a page with some text. She went to the copy machine and pushed the 50\% button, meaning that the dimensions of the paper would be half as big as normal.

a. If the original dimensions of the picture were 8.5 in. \(\times\) 11 in., what will be the dimensions of the new picture?

4.25 in. \(\times\) 5.5 in.

b. Draw the original and new picture on the grid. Label the dimensions.

c. If you know the area of the original picture, how might you figure out the area of the smaller picture (besides multiplying length and width)?

\((\frac{1}{2})^2 = \frac{1}{4}\), multiply the area by \(\frac{1}{4}\)

13. Let’s say that Mouse, Double-Dog and Triple-Threat-Tiger all have swimming pools. What would you predict about the scale factor of the volume as related to double or triple dimensions? Prove or adjust your prediction—say that Mouse has a pool which is 1 foot deep and 2 feet by 3 feet.

You would cube the scale factor of the lengths.
### 5.2e Self-Assessment: Section 5.2

Consider the following skills/concepts. Rate your comfort level with each skill/concept by checking the box that best describes your progress in mastering each skill/concept. Sample problems can be found on the following page.

<table>
<thead>

Sample Problems for Section 5.2

1. Draw a scaled version of the following polygons given the scale factor.
   a. Scale Factor: 2

   ![Scaled Polygon](image1.png)

   b. Scale Factor: ½

   ![Scaled Polygon](image2.png)

2. Find the missing measurement in each problem.
   a. The scale factor \( \triangle ABC \) to \( \triangle DEF \) is 3. If \( BC \) is 3, what is the length of \( EF \)?

   ![Diagram](image3.png)

   b. The scale factor \( \triangle GEL \) to \( \triangle HOP \) is \( \frac{3}{5} \). If \( OP \) is 30, what is the length of \( EL \)?

   ![Diagram](image4.png)
3. In each of the following, what is the scale factor that takes $\triangle ABC$ to $\triangle XYZ$?

a.

![Triangle ABC](image1)
![Triangle XYZ](image2)

b.

![Triangle ABC](image3)
![Triangle XYZ](image4)

4. Answer each of the following questions using proportional reasoning.

a. Becky is drawing a scale model of her neighborhood. She uses a scale of 1 in = 200 feet. If her block is 1000 feet long, what will be the length of the block on her scale model?

b. Carlos is reading a map of his town. The scale says 1 in = 4 miles. The distance from his house to the school is $\frac{3}{8}$ in. on the map. If Carlos wants to walk to school from his house, how far will he have to walk?

5. The dimensions of Romina’s rectangular garden are 2 feet by 3 feet. The dimensions of Santiago’s garden are all quadrupled.

a. Find the perimeter and area of each garden.

b. Find the scale factor between the perimeters of each garden.

c. Find the scale factor between the areas of each garden.

d. In general, how are the scale factors of perimeters and areas of scaled objects related?
Section 5.3: Solving Problems with Circles

Section Overview: In this section circumference and area of a circle will be explored from the perspective of scaling. Students will start by measuring the diameter and circumference of various circles and noting that the ratio of the circumference to the radius is constant (2π). This should lead to discussions about all circles being scaled versions of each other. Next students will “develop” an algorithm for finding the area of a circle using strategies used throughout mathematical history. In these explorations, students should discuss two ideas: 1) cutting up a figure and rearranging the pieces so as to preserve area, and 2) creating a rectangle is a convenient way to find area. Students will connect the formula for finding the area of a circle (πr²) to finding the area of a rectangle/parallelogram where the base is ½ the circumference of the circle and the height is the radius (A = Cr/2.)

Students end the section by applying what they have learned to problem situations. In Chapter 6, students will use ideas of how circumference and area are connected to write equations to solve problems, but in this section, students should solve problems using informal strategies to solidify their understanding.

Concepts and Skills to be Mastered (from standards)

Geometry Standard 4: Know the formulas for the area and circumference of a circle and use them to solve problems; give an informal derivation of the relationship between the circumference and area of a circle.

Geometry Standard 6: Solve real-world and mathematical problems involving area, volume and surface area of two- and three-dimensional objects composed of triangles, quadrilaterals, polygons, cubes, and right prisms. 7.G.6

1. Explain the relationship between diameter of a circle and its circumference and area.
2. Explain the algorithm for finding circumference or area of a circle.
3. Find the circumference or area of any circle given the diameter or radius; or given circumference or area determine the diameter or radius.
### 5.3a Class Activity: How Many Diameters Does it Take to Wrap Around a Circle?

1. Create one circle using either a) manual construction: a compass, tracing the base of a cylindrical object, or using a string compass, OR b) technology: GeoGebra, etc. (technology will allow for far more accurate measurement). Then, measure the circumference and diameter of the circle; collect measurements from five other students to fill in the table below.

<table>
<thead>
<tr>
<th>Measurement of the diameter in _______ units</th>
<th>Measurement of the circumference in _______ units (must be the same units as the diameter)</th>
<th>Ratio of circumference : diameter (C/d), as a decimal rounded to the nearest hundredth. Note: C represents circumference and d represents diameter.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>3.14</td>
</tr>
<tr>
<td></td>
<td></td>
<td>3.14</td>
</tr>
<tr>
<td></td>
<td></td>
<td>3.14</td>
</tr>
<tr>
<td></td>
<td></td>
<td>3.14</td>
</tr>
<tr>
<td></td>
<td></td>
<td>3.14</td>
</tr>
</tbody>
</table>

2. What do you notice about the values in the third column?

They are all about 3.14. You will need to Attend to Precision. Introduce \( \pi \). Explain that it represents the ratio of the circumference to the diameter of a circle. Students will study irrational numbers in 8th grade.

3. If you made a huge circle the size of a city and measured the diameter and circumference, would the ratio of circumference to diameter (C/d) be consistent with the other ratios in the third column of the table? Justify your answer using what you learned from the previous section.

All circles are scale drawings of each other so the ratio of circumference to diameter is always the same.

4. If you know the diameter of a circle is 5 inches, what is the approximate measure of the circumference? Justify your answer. 15.7 inches.
5. Write and justify a formula for circumference, in terms of the diameter.

\[ C = 3.14d \text{ extend this to } C = \pi d \quad \text{or} \quad C = \pi(2r) = 2\pi r \]

6. Write and justify a formula for the circumference, in terms of the radius.

\[ C = 3.14(2r) \text{ or } C = 6.28r \text{ or } C = 2\pi r. \]

You are pushing for students to look at the structure and repeated reasoning. In other words, all circles have the same shape. The ratio of their circumference to diameter is always the same so we can write the circumference as the diameter and a factor (\( \pi \)). We can repeat this reasoning with any circle. Note we are using the term “factor.” All circles are scaled versions of each other.

7. For each of the three circles below, calculate the circumference of the circle. Express your answer both in terms of \( \pi \), and also as an approximation to the nearest tenth. Please note: drawing is not to scale.

![Circles with dimensions](image)

- radius = 0.5 cm
  - circumference = \( C \)
  - Solve for \( C \).
  - \( C = 3.14 \text{ cm} \)
  - \( C = \pi \text{ cm} \)

- Diameter = 2.5 cm
  - circumference = \( C \)
  - Solve for \( C \).
  - \( C = 7.85 \text{ cm} \)
  - \( C = 2.5\pi \text{ cm} \)

- radius = 3 units
  - circumference = \( C \)
  - Solve for \( C \).
  - \( C = 18.84 \text{ units} \)
  - \( C = 6\pi \text{ units} \)

Discuss “exact” v “approximate.” In the problems above, the second answer, written in terms of \( \pi \), is the exact answer. The first answer is an approximate.

8. If the circumference of a circle is \( 8\pi \) (approximately 25.1) inches, which of the following is true? Rewrite false statements to make them true.

a. The ratio of Circumference: Diameter is 8. \text{ False: the ratio is } \frac{8\pi}{8} \text{ or } \pi

b. The radius of the circle is \( \frac{1}{2} \) the circumference. \text{ False: the radius is } \frac{1}{2} \text{ the diameter.}

c. The diameter of the circle is twice the radius. \text{ True}

d. The radius of the circle is 8 inches. \text{ False: the radius is 4 inches.}

e. The diameter of the circle is 8 inches. \text{ True}
9. The circumference of 5 objects is given. Calculate the diameter of each object, to the nearest tenth of a unit.

- Circumference of bike wheel: 76.9"
- Circumference of car tire: 78.1"
- Circumference of lid: 11"
- Circumference of top of garbage can: 50"
- Circumference of plate: 31"

\[ d = \frac{C}{\pi} \]

- \[ d = \frac{76.9}{\pi} \approx 24.5" \]
- \[ d = \frac{78.1}{\pi} \approx 24.9" \]
- \[ d = \frac{11}{\pi} \approx 3.5" \]
- \[ d = \frac{50}{\pi} \approx 15.9" \]
- \[ d = \frac{31}{\pi} \approx 9.9" \]

10. The diameter or radius of 5 objects is given. Calculate the circumference of each object, to the nearest tenth of a unit.

- Diameter of masking tape: 5"
- Radius of clock face: 11"
- Diameter of ring: 2.5 cm
- Diameter of Ferris wheel: 50'
- Radius of steering wheel: 9"

\[ C = 2\pi r \]

- \[ C = 2\pi \times 5" \approx 15.7" \]
- \[ C = 2\pi \times 11" \approx 69.08" \]
- \[ C = 2\pi \times 2.5 \text{ cm} \approx 15.7 \text{ cm} \]
- \[ C = 2\pi \times 50' \approx 314' \]
- \[ C = 2\pi \times 9" \approx 56.62" \]

11. When a unicyclist pedals once, the wheel makes one full revolution, and the unicycle moves forward the same distance along the ground as the distance around the edge of the wheel. If Daniel is riding a unicycle with a diameter of 20 inches, how many times will he have to pedal to cover a distance of 50 feet? Show all your work.

50 feet = 600 inches.
\[ C \text{ of unicycle} = 20\pi \text{ in.} = 62.8 \text{ in.} \]
\[ 600 \div 62.8 = 9.55 \text{ revolutions.} \]

He will have to pedal 9.55 times.
Spiral Review

1. Factor the following expressions.
   \[4x - 10 \quad 2(2x - 5) \quad 21x + 35 \quad 7(3x + 5) \quad 5.4t - 2.7 \quad .9(6t - 3)\]

2. Use a model to represent \(-7 + 14 = 7\)

3. Find 30% of 240 without a calculator. \(72\)

4. Without using a calculator, determine which fraction is bigger in each pair. Justify your answer with a picture and words.
   a. \(\frac{21}{25} \quad \text{or} \quad \frac{3}{5}\)
   b. \(\frac{6}{11} \quad \text{or} \quad \frac{8}{14}\)

5. Milly bought two sweaters for $30 and three pair of pants for $25. She had a 20% off coupon for her entire purchase. Model or write an expression for the amount of money Millie spent. \(108\)

\[2(30) + 3(25)] = 135
135 (.20) = 27
135 - 27 = 108\]
5.3a Homework: How Many Diameters Does it Take to Wrap Around a Circle?

1. Identify 5 circular objects around the house (canned foods, door knobs, cups, etc.). Find the measure of each object’s diameter and then calculate its circumference. Put your results in the table below:

<table>
<thead>
<tr>
<th>Description of item</th>
<th>Diameter (measured)</th>
<th>Circumference (calculated)</th>
<th>Ratio of ( C : d ) (calculated) to the nearest hundredth</th>
</tr>
</thead>
<tbody>
<tr>

</tbody>
</table>

2. What is the exact ratio of the circumference to the diameter of every circle?

\[ \pi \]

3. If the radius of a circle is 18 miles,
   a. What is the measure of the diameter?

b. What is the measure of the circumference, exactly in terms of \( \pi \)?

c. What is the approximate measure of the circumference, to the nearest tenth of a mile?

4. For each of the three circles below, calculate the circumference. Express your answer both in terms of \( \pi \), and also as an approximation to the nearest tenth.

\[
\begin{align*}
\text{radius} &= 1.5 \text{ cm} \\
\text{circumference} &= C \\
\text{Solve for } C.
\end{align*}
\]

\[
\begin{align*}
\text{Diameter} &= 5 \text{ cm} \\
\text{circumference} &= C \\
\text{Solve for } C.
\end{align*}
\]

\[
\begin{align*}
\text{radius} &= 9 \text{ units} \\
\text{circumference} &= C \\
\text{Solve for } C.
\end{align*}
\]

\[ C = 3\pi \text{ cm} \]

\[ C = 9.4 \text{ cm} \]
5. The decimal for $\pi$ starts with 3.141592653589… Which fraction is closest to $\pi$? (Note: there is no fraction that is exactly equal to $\pi$.)

- a) $3 \frac{1}{4}$
- b) $3 \frac{1}{5}$
- c) $3 \frac{1}{7}$
- d) $3 \frac{1}{6}$
- e) $3 \frac{1}{8}$

6. If the circumference of a circle is $20\pi$ feet, which of the following statements are true? Rewrite false statements to make them true.
   a. The circumference of the circle is exactly 62.8 feet. **False**: circumference is approximately 62.8 ft
   b. The diameter of the circle is 20 feet.
   c. The radius of the circle is 20 feet. **False**: the radius is 10 feet
   d. The ratio of circumference : diameter of the circle is $\pi$.
   e. The radius of the circle is twice the diameter.

7. The circumference of 5 objects is given. Calculate the diameter of each object, to the nearest tenth of a unit.

- Circumference of bottom of cupcake: 6.5”
  - $d = 2.1”$
- Circumference of top of mug: 13”
- Circumference of wheel: 314 cm
- Circumference of top of water pail: 100 cm
- Circumference of earth: 24,901 miles
  - $d = 7,930.3$ miles
8. The diameter or radius of 5 objects is given. Calculate the circumference of each object, to the nearest tenth of a unit.

\[ C = 50.2'' \] \hspace{1cm} \[ C = 34.5'' \]

9. Three tennis balls are stacked and then tightly packed into a cylindrical can. Which is greater: the height of the can, or the circumference of the top of the can? Justify your answer.
10. Calculate the radius for each circle whose circumference is given in the table (the first entry is done for you). Then graph the values on a coordinate plane, with the radius on the x axis and the approximate circumference on the y axis.

<table>
<thead>
<tr>
<th>Radius of circle</th>

<td>12π un ≈ 38 un</td>
</tr>
</tbody>
</table>

11. Is the radius of a circle proportional to the circumference of the circle? Justify your answer.

Yes, the graph is a straight line.
5.3b Classwork: Area of a Circle

Activity: Circle Area

History: Methods for computing the area of simple polygons were known to ancient civilizations like the Egyptians, Babylonians and Hindus from very early times in Mathematics. But computing the area of circular regions posed a challenge. Archimedes (287 BC – 212 BC) wrote about using a method of approximating the area of a circle with polygons. Below, you will try some of the methods he explored for finding the area of a circle of diameter 6 units.

a) Estimate the area of the circle by counting the number of square units in the circle.

Estimated area = _____________________

b) Estimate the area of the circle by averaging the inscribed and circumscribed squares.

Estimated area = ____________________

c) In the figure below on the left, the large square circumscribing the circle is divided into four smaller squares. Let’s call the four smaller squares “radius squares.” The four radius squares are lined up below on the right. Estimate the number of squares units (grid squares) there are in the circle and then transfer them to the four radius squares below.

The idea here is to fill in the area of a little over 3 radius squares. Students should see that a ¼ portion of the circle is a bit more than 7 square units, so the whole area of the circle is a little over 28 square units. The area of the large rectangle is 36 sq un., thus the area of the circle is about 28/36 of the large rectangle. Student might also say it’s a bit more than ¾ the area of the large square or about 3 of the smaller radius squares.

How many radius squares cover the same area as the circle? ____________
Johannes Kepler (1571-1630) tried a different approach: he suggested dividing the circle into “isosceles triangles” and then restructuring them into a parallelogram. Refer to the Mathematical Foundation for more information about this approach.

Cut the circle into eighths. Then fit and paste the eighths into a long line (turn the pie pieces opposite ways) to create a “parallelogram.”

Students should end up with a figure like the one on the next page. Remind them that the area of a parallelogram is height times base. Discuss what the height and the base are relative to the original circle. This activity is extended in the next activity.
The figure to the left shows the same circle of radius 3 as the previous example, but this time cut into 10 wedges. How will this parallelogram compare to the one created with 8 wedges above? The edges will be smoother. More of a parallelogram. There will be less approximation because the “gap” will be smaller.

Will the area created by reorganizing the pieces be the same or different than the original circle? Explain. All the areas will be the same.

In the next diagram, the same circle of radius 3, but this time it’s cut into 50 wedges. Again it is packed together into a parallelogram.

Highlight the circumference of the circle. Then highlight where the circumference is found in the new diagram. Explain why the base of the “parallelogram” is half the circumference of the circle.

Half the circumference is on the top of the “rectangle,” the other half is on the bottom.

Highlight the radius of the circle in a different color. Then highlight where the radius is found in the new diagram. Explain why the height of the “parallelogram” is the same as the radius. It cuts right down the middle of one of the slices.

Use the figure and what you know about the area of a rectangle to write an expression for the area of the circle.

\[ A = \pi r^2 \]
1. Estimate the area of the circle in square units by counting.

![Image of a circle](image)

2. Use the formula for the area of a circle to calculate the exact area of the circle above, in terms of \( \pi \).

\[ 36\pi \] square units

3. Calculate the area for #2 to the nearest square unit. How accurate was your estimate in #1?

113 square units

4. Calculate the area of each circle. Express your answer both exactly (in terms of \( \pi \)) and approximately, to the nearest tenth of a unit.

![Three circles with different radii](image)

A = \( 12.25\pi \) sq. ft.
A = 38.5 sq. ft.
5. A certain earthquake was felt by everyone within 50 kilometers of the epicenter in every direction.
   a. Draw a diagram of the situation.
   b. What is the area that felt the earthquake?

\[ 2500\pi \text{ or } 7,825 \text{ square kilometers} \]

6. There is one circle that has the same numeric value for its circumference and its area (though the units are different.) Use any strategy to find it. Hint: the radius is a whole number.

A circle with a radius of 2.

Earlier in this section, we noted that the ratio \( C:d \) (or \( C:2r \)) is \( \pi \) for all circles. We then noticed that the area for all circles is \( Cr^2 / 2 \) (e.g. \( 2\pi r \times r / 2 \) or \( \pi r^2 \)). Thus the ratio of area of a circle to \( r^2 \) (or \( A/r^2 \)) is also \( \pi \). \( 2r = r^2 \) only for \( r = 2 \) so \( A = C \) only for \( r = 2 \). The fact that the ratios of both \( C:d \) (or \( C:2r \)) and \( A:r^2 \) are the same constant, \( \pi \), is very interesting (and important). A more thorough development of this concept is offered in the Mathematical Foundation. The idea that the circumferences of two circles are related by the scale factor taking one circle’s radius to the other should connect to the notion that the perimeter of scaled polygons are related to the scale factor for the sides (as discussed earlier in this chapter). In the case of area, for both the circle and polygons, the area is proportional to the square of the linear scale factor.

7. Explain the difference in the units for circumference and area for the circle in #6. Circumference is a length, so it is in just units. Area is in square units.

8. Draw a diagram to solve: A circle with radius 3 centimeters is enlarged so its radius is now 6 centimeters.
   a. By what scale factor did the circumference increase? Show your work or justify your answer.

   \[ 2 \]
   b. By what scale factor did the area increase? Show your work or justify your answer.

   \[ 4 \]
   c. Explain why this makes sense, using what you know about scale factor.

   The scale factor of the area is always the square of the scale factor of the lengths.

9. How many circles of radius 3” can you fit in a circle with radius 12” (if you could cut up the smaller circles to tightly pack them into the larger circle with no gaps)? See the image below. Justify your answer.

\[ 16, \text{ because the scale factor of the radii is 4, so the scale factor of the area is going to be } 4^2 \text{ or } 16. \text{ Another way to think about it: the area of the larger circle is } 144\pi, \text{ while the area of the smaller circle is } 9\pi. \text{ Thus, } 16 \text{ of the smaller circles make up the larger.} \]
10. Calculate the radius for each circle whose area is given in the table (the first entry is done for you). Then graph the values on a coordinate plane, with the radius on the $x$ axis and the approximate area on the $y$ axis.

<table>
<thead>

<td>$4\pi \text{ un}^2 \approx 12 \text{ un}^2$</td>
</tr>
</tbody>
</table>

11. Is the radius of a circle proportional to the area of the circle? Justify your answer.

No, the graph is not a straight line. This should start a good conversation about rates of change that are one dimensional (perimeter) versus those that are two dimensional (area.)

Connect this exercise with 5.3a Homework #10.
12. The area of 5 objects is given. Calculate the radius of each object’s surface, to the nearest hundredth of a unit.

![Images of objects with their areas: smiley face (3.14 in²), base of a plant pot (50.24 in²), target (153.86 in²), circular tile pattern (78.5 ft²), glass in round window (12.56 ft²).]

Spiral Review

1. \(7z + 1 = 15\) \(z = 2\)

2. \(-15 = 1.2m + 2.4\) \(m = -14.5\)

3. Show two ways one might simplify: \(5(3 + 4)\) \(15 + 20 = 35\) or \(5(7) = 35\)

4. There are a total of 214 cars and trucks on a lot. If there are four more than twice the number of trucks than cars, how many cars and trucks are on the lot?

\[
\begin{align*}
(2t + 4) + t &= 214 \\
3t &= 210 \\
t &= 70
\end{align*}
\]

\[
\begin{align*}
trucks &= 70 \\
cars &= 144
\end{align*}
\]

5. \(-1 \times 4 \times -7\) \(-28\)
5.3b Homework: Area of a Circle

1. Estimate the area of the circle in square units by counting.

2. Use the formula for the area of a circle to calculate the exact area of the circle above, in terms of pi.

3. Calculate an approximation for the area expression from #2, to the nearest square unit. How accurate was your estimate in #1?

4. Calculate the area of each circle. Express your answer both exactly (in terms of pi) and approximately, to the nearest tenth of a unit.

\( A = 42.25\pi \text{ sq. in.} \)
\( A = 132.7 \text{ sq. in.} \)
5. The strongest winds in Hurricane Katrina extended 30 miles in all directions from the center of the hurricane.
   a. Draw a diagram of the situation.

   b. What is the area that felt the strongest winds?
      \[900\pi \text{ or } 2827 \text{ sq. mi.}\]

6. By calculating the areas of the square and the circle in the diagram, determine how many times larger in area the circle is than the square.

7. Draw a diagram to solve: A circle with radius 8 centimeters is enlarged so its radius is now 24 centimeters.
   a. By what scale factor did the circumference increase? Show your work or justify your answer.

   b. By what scale factor did the area increase? Show your work or justify your answer.

   c. Explain why this makes sense, using what you know about scale factor.
8. How many circles of radius 1" could fit in a circle with radius 5" (if you could rearrange the area of the circles of radius 1 in such a way that you completely fill in the circle of radius 5)? Justify your answer.

9. The area of 5 objects is given. Calculate the radius of each object’s surface, to the nearest hundredth of a unit.

- Area of a glass in a porthole: 3.14 ft²
- Area of side of a water tank: 153.86 ft²
- Area of wicker table top: 28.26 ft²
- Area of base of trash can: 12.56 ft²
- Area of round area rug: 153.86 ft²

\[ r = 7' \]

Sample Problems for Section 5.3

1. Use pictures and/or words to explain:
   a. The relationship between the diameter of a circle and its circumference
   b. The relationship between the diameter of a circle and its area

2. Use pictures and/or words to explain:
   a. The algorithm for finding the circumference of a circle
   b. The algorithm for finding the area of a circle

3. Use the given information to find the missing information. Give each answer exactly and rounded to the nearest hundredth unit.
   a. Radius: 2 m
      Circumference: ____________
   d. Diameter: 40 in
      Area: ____________

   b. Diameter: 2 m
      Circumference: ____________
   e. Circumference: 69.08 cm
      Diameter: ____________

   c. Radius: 5.5 in
      Area: ____________
   f. Area: 153.86 cm²
      Radius: ____________
Section 5.4: Angle Relationships

Section Overview: In this section students will learn and begin to apply angle relationships for vertical angles, complementary angles and supplementary angles. They will practice the skills learned in this section further in Chapter 6 when they write equations involving angles. Students will also use concepts involving angles to relate scaling of triangles and circles. At the end of this section there is a review activity to help students tie concepts together.

Concepts and Skills to be Mastered (from standards)

Geometry Standard 5: Use facts about supplementary, complementary, vertical, and adjacent angles in a multi-step problem to write and solve simple equations for an unknown angle in a figure.

Geometry Standard 6: Solve real-world and mathematical problems involving area, volume and surface area of two- and three-dimensional objects composed of triangles, quadrilaterals, polygons, cubes, and right prisms. 7.G.6

1. Identify vertical, complementary and supplementary angles.
2. Find the measures of angles that are vertical, complementary or supplementary to a known angle.
3. Apply angle relationships to find missing angle measures. Given angle measures, determine the angle relationship.
5.4a Classwork: Special Angle Relationships

This diagram is a regular pentagon with all its diagonals drawn and all points labeled.

1. How many non-overlapping angles are in the diagram?
   35

2. There are groups of angles that all have the same measure. For example, \(\angle DEG\) and \(\angle AEF\) have the same measure. How many different measures of angles are there in the diagram? Use a protractor.
   3

Vertical Angles: Two lines that intersect form vertical angles. Vertical angles are pairs of angles that are always opposite one another (rather than adjacent to each other). For example, \(\angle EFG\) and \(\angle AFI\) are vertical angles.

Adjacent Angles: Two angles are adjacent if they have a common ray (side) and vertex. For example, \(\angle EFG\) and \(\angle EFA\) are adjacent angles.

3. Name at least five vertical angle pairs. Use a different colored pencil to mark each pair in the diagram above.

4. Name at least five adjacent angle pairs. Use a different colored

5. What seems to be the relationship between measures of two vertical angles? Draw another pair of vertical angles below by constructing two intersecting lines and measure the two angles in the vertical pair. Does this example support your conjecture?

Vertical angles have the same measurement.
6. Find and name at least 5 pairs of supplementary angles in the diagram. Use a different color to mark each pair in the diagram.

7. For each pair of intersecting lines below, find the three missing measures of angles formed. Justify your answer in the table.

$$\angle DGE$$ and $$\angle EGF$$ are called supplementary angles because their measures add to 180°. When supplementary angles are adjacent, you can see that they form a straight line with the two outside rays. Supplementary angles don’t always have to be next to each other.

For #6 and #7, note that vertical angles are both supplementary to the same angle.
8. For this rectangle with diagonals drawn in, there is one place where you can see supplementary and vertical angles. Use a protractor to measure one of the angles, and then calculate the measures of the other three angles that have vertex at E using facts about vertical and supplementary pairs.

\[ \angle AED = 60^\circ \]
\[ \angle DEC = 120^\circ \]
\[ \angle DEB = 60^\circ \]
\[ \angle BEA = 120^\circ \]

\[ \angle EAB \text{ and } \angle DAE \] are complementary because their measures add to 90°. When complementary angles are adjacent, you can see the right angle that is formed by the outside rays. However, complementary angles don’t need to be adjacent; as long as their measures add to 90 degrees, two angles form a complementary pair.
9. Find and name at least five more pairs of complementary angles in the figure above. Use a different highlighter to mark each pair on the diagram.

10. Review: What is the sum of all the angles in a triangle?
    The sum of the angles in a triangle is 180 degrees.

11. Consider a right triangle. What seems to be true about the two non-right angles in the triangle? Use the examples below, or draw your own examples to help with your conjecture.

    The two non-right angles are complementary.

12. Look around the room you’re in right now. Find examples of angles in the furniture, tiles, posters, etc. Can you see any complementary angles? Can you see supplementary angles? Can you see vertical angles? Draw sketches for at least three angle pairs you find.
For #13-14, use properties of complementary, supplementary, and vertical angles to find missing measures.

13. Two pair of seesaws sit unused at a playground, as shown. \( \angle EGF \) has a measure of 140°. 
   a. Which angle is vertical to \( \angle EGF \)? \( \angle CGH \)
   
   b. What is the measure of \( \angle CGH \)? 
   
   140°
   
   c. Name an angle that is 
   supplementary to \( \angle EGF \). \( \angle CGE \) and \( \angle HGF \)
   
   d. What is the measure of \( \angle CGE \)? 40°
   
   e. What is the measure of \( \angle HGF \)? 40°

14. In the diagram below, \( \angle ADB \) is a right angle. The figure is formed by 3 intersecting lines.

Fill in the measures and justifications in the table:

<table>
<thead>
<tr>
<th>Angle</th>
<th>Measure</th>
<th>Justification</th>
</tr>
</thead>
<tbody>
<tr>
<td>( \angle CDA )</td>
<td>90°</td>
<td>Supplementary to ( \angle ADB ), which is 90.</td>
</tr>
<tr>
<td>( \angle ADG )</td>
<td>24°</td>
<td>Vertical to ( \angle EDF )</td>
</tr>
<tr>
<td>( \angle GDB )</td>
<td>66°</td>
<td>Complimentary to ( \angle ADG )</td>
</tr>
<tr>
<td>( \angle BDF )</td>
<td>90°</td>
<td>Supplementary to ( \angle ADB )</td>
</tr>
<tr>
<td>( \angle EDC )</td>
<td>66°</td>
<td>Complimentary to ( \angle EDF )</td>
</tr>
</tbody>
</table>
Spiral Review

1. Order the numbers from least to greatest. \(- \frac{1}{2}, \frac{1}{4}, -\frac{1}{4}, -1.2, -1.02, -0.75\) \(-1.2, -1.02, -0.75, -\frac{1}{2}, -\frac{1}{4}, \frac{1}{4}\)

2. Find the quotient: \(\frac{8}{9} \cdot \left( \frac{3}{4} \right) = \frac{32}{27}\)

3. Find the unit rate for BOTH units.
   Izzy drove 357 miles on 10 gallons of gasoline.
   \(\frac{357}{10} = \frac{35.7 \text{ miles}}{1 \text{ gal}}\) and \(\frac{10}{357} = \frac{0.028 \text{ gal}}{1 \text{ mile}}\)

4. Convert the following units using the ratios given:
   \(\frac{3}{12} \text{ feet} = 37 \text{ inches} (1 \text{ foot} = 12 \text{ inches})\)

5. The temperature at midnight was 8° C. By 8 AM, it had risen 1.5°. By noon, it had risen a additional 2.7°. Then at 6 PM a storm blew in causing it to drop 4.7°. What was the temperature at 6 PM? 7.5°
5.4a Homework: Special Angle Relationships

1. Find at least one example of each angle relationship in the diagram. Name the angle pairs below, and highlight the pairs of angles in the diagram, using a different color for each relationship.

a) Vertical angles

b) Supplementary angles

c) Complementary angles
2. For each figure of two intersecting lines, calculate the three missing measures, justifying your answer.

<table>
<thead>
<tr>
<th>Angle</th>
<th>Measure of angle</th>
<th>Justification</th>
</tr>
</thead>
<tbody>
<tr>
<td>∠CEB</td>
<td>156°</td>
<td>Supplementary to ∠AEC</td>

<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

4. Refer to the figure below.

$m\angle AZU = 63^\circ$ because it is complimentary to $\angle AZW$
5. Fill in the missing angle measurements in the table, and give a justification for each measurement.

\[
\begin{array}{|c|c|c|c|c|c|}
\hline
\text{Angle} & \angle ADG & \angle GDB & \angle BDH & \angle CDH & \angle CDE & \angle CDA \\
\hline
\text{Measure} & 57^\circ & 33^\circ & & 90^\circ & & \\
\hline
\text{Justification} & \text{Vertical to } \angle EDH & \text{Complimentary to } \angle ADG & & \text{Vertical to } \angle ADB & & \\
\hline
\end{array}
\]

For #6-8, draw a diagram to illustrate the situation, and then choose the correct answer.

6. If \( \angle G \) is complementary to \( \angle H \), and \( m\angle H = 20^\circ \), then \( \angle G \) must be:
   - a. Obtuse
   - b. Acute
   - c. Right

7. If \( \angle B \) is supplementary to \( \angle C \), and \( m\angle C = 90^\circ \), then \( \angle B \) must be:
   - d. Obtuse
   - e. Acute
   - f. Right

8. If \( \angle D \) is vertical to \( \angle E \), and \( m\angle E = 115^\circ \), then \( \angle E \) must be:
   - g. Obtuse
   - h. Acute
   - i. Right
5.4b Classwork: Circles, Angles, and Scaling

Examine the figures below. $BC$ has a length of 5 units.

1. Write a complete sentence explaining why the figures are scale drawings of each other. You may use a protractor. Use words like corresponding angles, scale factor, corresponding sides, circle. See student responses. The angles at $A$ and $E$ are both right. $AB$ & $EF$, $AC$ & $EG$, and $BC$ & $FG$ are all corresponding sides. The ratio of $AB:EF$ is $3:6$; $AC:EG$ is $4:8$; $BC:FG$ is $5:10$. Because the scale factor from the small to the large figure is 2, we know that the area of the larger figure is 4 times that of the smaller. *This will all be discussed in the questions below.

2. Remember that you have been given that $BC$ has length 5. What is the radius of each circle? Justify your answer.

$$\text{radius } \odot D = 2.5, \text{ radius } \odot H = 5, \text{ the scale factor between the two figures is } 1:2$$

3. Calculate the area of each triangle.

$$\text{Area } \triangle ABC = 6 \text{ square units, Area } \triangle EFG = 24 \text{ square units}$$

4. Classify the triangles by their sides and angles.

They are both scalene right triangles.
5. Name two pairs of complementary angles in the figures.

\[ \angle ABC \text{ } \& \text{ } \angle ACB \text{ } \& \text{ } \angle EFG \text{ } \& \text{ } \angle EGF \]

6. What is the area of each circle?

\[ \text{Area } \odot D = 6.25\pi \text{ or } 19.63 \text{ sq. units, Area } \odot H = 25\pi \text{ or } 78.54 \text{ sq. units} \]

7. How many of the smaller circle would fit inside the bigger circle, if you could put all the area in without overlapping and with no empty space?

4

8. What is the circumference of each circle?

\[ \text{Circumference } \odot D = 5\pi \text{ or } 15.71 \text{ units, Circumference } \odot H = 10\pi \text{ or } 31.42 \text{ units} \]

9. How many of the circumferences of the smaller circle equal the bigger circumference?

2

10. Fill in the blanks: When you enlarge a figure with a scale factor of two, the side lengths and circumference **double**, the areas **multiply by 4**, and the angles **stay the same**.

11. You could construct other figures that are similar to these two figures with a different scale factor. What would be the dimensions of the triangle with scale factor \(\frac{1}{2}\) from the figure on the left? What would be the radius of the circle?

Triangle: dimensions 1.5 units by 2 units and the radius of the circle would be 1.25 units

12. Follow the steps below to create another figure in the space below:
   a. Make a dot for the center of a circle, and use a compass to construct a circle around that dot.
   b. Use a straightedge to draw in a diameter with endpoints labeled \(A\) and \(B\).
   c. Choose any point on the edge of the circle, and label it \(C\).
   d. Draw in segments \(AC\) and \(BC\) so you can see a triangle \(ABC\) inscribed in the circle.
   e. Measure the angles in the triangle, and classify the triangle.
   f. Are there any pairs of complementary angles? If so, name them. **Yes, \(\angle CAB \text{ } \& \text{ } \angle ABC\).**

Extension: Honors students should explore why triangles inscribed on a semi circle are right triangles.
Spiral Review

1. Convert the following units using the ratios given: \( \frac{3}{4} \text{ tons} = \_1500\_ \text{ pounds} \) (1 ton = 2000 pounds)

2. Solve the following proportion equations:
   \[ \frac{9}{x} = \frac{15}{25} \]
   \[ x = 15 \]

3. Without a calculator, what percent of 90 is 60? \( 66\frac{2}{3}\% \)

4. Use a model to show \(-17 + 5 \quad -12\)

5. Alli owes her mom $124. Alli made four payments of $20 to her mom. How much does Alli now owe her mother?
   \[ 124 - (20 \cdot 4) = 44 \]
5.4b Homework: Review Assignment

Decide if the figures below are possible. Justify your conclusion with a mathematical statement. To construct the triangles use:

- A ruler or strips of centimeter graph paper cut to the given lengths
- A protractor
- Construction technology like GeoGebra

2. A triangle with angles that measure 20°, 70°, and 90°?
   
   Possible or not? Why or why not?
   
   If so, what kind of triangle? Sketch, label.

3. A triangle with sides 8 and 3 cm. The angle opposite the 3 cm side measures 45°.
   
   Possible or not? Why or why not?
   
   If so, what is the measure of the 3rd side? Sketch, label.
   
   Possible. The measure of the other side is approximately 10.

4. A triangle with sides of 8 cm and 3 cm. The angle opposite the 8 cm side measures 45°.
   
   Possible or not? Why or why not?

5. Two students were building a model of a car with an actual length of 12 feet.

   a. Andy’s scale is $\frac{1}{4} \text{ inch} = 1 \text{ foot}$. What is the length of his model? 3 inches

   b. Kate’s scale is $\frac{1}{2} \text{ inch} = 1 \text{ foot}$. What is the length of her model?
6. At Camp Bright the distance from the Bunk House to the Dining Hall is 112 meters and from the Dining Hall to the Craft Building is 63 meters (in the opposite direction). The scale of the map for the camp is $0.5cm = 14meters$. On the map,…

   a. …what is the scaled distance between the Bunk House and the Dining Hall?
   b. …what is the scaled distance between the Dining Hall and the Craft Building?

Have student that struggle draw a model. A length of 112 meters has a total of eight 14 meter units. Each 14 meter unit is ONE 0.5 cm on the scaled map. Thus the length on the scaled map is 4 cm.

7. In the similar L figures,
   a. What is the ratio of height of left figure : height of right figure? 9:3 or 3:1
   b. What is the reducing scale factor? 1/3
   c. What is the ratio of area of left figure: area of right figure? 36:4 or 9:1. The area scale factor will be the unit scale factor squared.

8. Triangles $ABC$ and $RST$ are scale versions of each other.
   d. What is the scale factor from $\triangle ABC$ to $\triangle RST$?
   e. What is the scale factor from $\triangle RST$ to $\triangle ABC$?
   f. What is the distance between $A$ and $C$?
   g. What is the distance between $R$ and $S$?
      \[8 \times \frac{3}{4} = 6\]
9. Redraw the figures at right using the scale factors below.

a. Use a scale factor of 4 to re-draw the square.

b. Use a scale factor of ¼ to re-draw the addition sign.

c. Use a scale factor of 1.5 to re-draw the division sign.

10. The Washington Monument is 555 feet and 5 1/8 feet tall. Bob wants to create a scale model of it that is no more than 6 feet tall. What scale would you suggest Bob use for his model?
11. Calculate the circumference and area of the circles below. Express each measurement both exactly in terms of pi, and as an approximation to the nearest tenth of a unit.

- a. \( C = 0.5\pi \text{ cm} \) 
  \( C \approx 1.571 \text{ cm} \)
- b. \( C = \) 
  \( C \approx \)
- c. \( C = \) 
  \( C \approx \)

\[ A = 0.06\pi \text{ sq. cm} \]
\[ A \approx 0.196 \text{ sq. cm} \]

12. How many times would a circle with radius 4 units fit inside a circle with radius 12 units, if you could pack the area tightly with no overlapping and no leftover space?

13. Are all circles similar? Justify your answer.

Yes, because the ratio between the sides of all squares is 1:1

15. Are all rectangles scaled versions of each other? Justify your answer.

No, ratios can differ. This is an important question. All regular figures and circles are scaled versions of each other. Rectangles all have the same angles, but consecutive sides are not always in the same ratio.

16. A circle has an area of \( 144\pi \text{ mm}^2 \). What is its circumference? Show your work.
17. Find the missing angle measures for the figure below. Justify each answer.

\[ \angle MOL = 62^\circ, \text{ vertical to } \angle NOK \]
\[ \angle LON = 118^\circ, \text{ supplementary to } \angle NOK \]
\[ \angle KOM = 118^\circ, \text{ supplementary to } \angle NOK \]

18. Find all the missing angle measures for the figure below. Justify each answer.

19. Draw and label two intersecting lines for which \( \angle CDE \) and \( \angle ADR \) are vertical angles.

20. Draw and label two intersecting lines for which \( \angle HOG \) and \( \angle GOX \) are supplementary.

21. Draw and label a pair of adjacent complementary angles \( \angle ABC \) and \( \angle BCD \).
5.4c Self-Assessment: Section 5.4

Consider the following skills/concepts. Rate your comfort level with each skill/concept by checking the box that best describes your progress in mastering each skill/concept. Sample problems can be found on the following page.

Sample Problems for Section 4.4

1. Identify the shaded angle pairs diagramed below as vertical, supplementary, or complementary.
   a. 
   c. 
   b. 
   d. 

2. Use the relationship given to find the missing angle.
   a. If ∠G is complementary to ∠H, and \( m\angle H = 52^\circ \), then ∠G must be _____________.
   b. If ∠J is supplementary to ∠K, and \( m\angle J = 168^\circ \), then ∠K must be _____________.
   c. If ∠N is vertical to ∠M, and \( m\angle M = 98^\circ \), then ∠N must be _____________.
3. In the diagram below, find all missing angles. Justify with the appropriate angle relationship.

4. Given the measures of the following angles, identify the possible angle relationship(s).
   a. \( m\ ABC = 10^\circ \) and \( m\ DBC = 80^\circ \)
   b. \( m\ ABC = 24^\circ \) and \( m\ EBF = 24^\circ \)

Chapter 6: Real World Equations and Inequalities
(2-3 Weeks)

UTAH CORE Standard(s)

1. Understand that rewriting an expression in different forms in a problem context can shed light on the problem and how the quantities in it are related. For example, \( a + 0.05a = 1.05a \) means that “increase by 5%” is the same as “multiply by 1.05.” 7.EE.A.2

2. Solve multi-step real-life and mathematical problems posed with positive and negative rational numbers in any form (whole numbers, fractions, and decimals), using tools strategically. Apply properties of operations to calculate with numbers in any form; convert between forms as appropriate; and assess the reasonableness of answers using mental computation and estimation strategies. For example: If a woman making $25 an hour gets a 10% raise, she will make an additional 1/10 of her salary an hour, or $2.50, for a new salary of $27.50. If you want to place a towel bar 9 3/4 inches long in the center of a door that is 27 1/2 inches wide, you will need to place the bar about 9 inches from each edge; this estimate can be used as a check on the exact computation. 7.EE.B.3

3. Use variables to represent quantities in a real-world or mathematical problem, and construct simple equations and inequalities to solve problems by reasoning about the quantities. 7.EE.B.4
   a. Solve word problems leading to equations of the form \( px + q = r \) and \( p(x + q) = r \), where \( p \), \( q \), and \( r \) are specific rational numbers. Solve equations of these forms fluently. Compare an algebraic solution to an arithmetic solution, identifying the sequence of the operations used in each approach. For example, the perimeter of a rectangle is 54 cm. Its length is 6 cm. What is its width? 7.EE.B.4a
   b. Solve word problems leading to inequalities of the form \( px + q > r \) or \( px + q < r \), where \( p \), \( q \), and \( r \) are specific rational numbers. Graph the solution set of the inequality and interpret it in the context of the problem. For example: As a salesperson, you are paid $50 per week plus $3 per sale. This week you want your pay to be at least $100. Write an inequality for the number of sales you need to make, and describe the solutions. 7.EE.B.4b

4. Use facts about supplementary, complementary, vertical, and adjacent angles in a multi-step problem to write and solve simple equations for an unknown angle in a figure. 7.G.5

CHAPTER OVERVIEW:
This chapter brings together several ideas. The theme throughout however is writing equations or inequalities to represent contexts. In the first section students work with ideas in geometry and represent their thinking with equations. Also in that section students solidify their understanding of the relationship between measuring in one-, two-, and three-dimensions. In the second section, students will be writing equations for a variety of real life contexts and then finding solutions. The last section explores inequalities. This is the first time students think about solutions to situations as having a range of answers.

VOCABULARY:
algebraic, inequality, equation, inverse operations, solution, at most, at least, less than, greater than, \(<, >, \leq, \geq\), supplementary, complementary, vertical angles, adjacent angles, intersecting lines

CONNECTIONS TO CONTENT:
Prior Knowledge
In Chapter 3 students learned how to solve one-step and simple multi-step equations using models. In this chapter students extend that work to more complex contexts. In particular they build on understandings developed in Chapter 5 about geometric figures and their relationships. Work on inequalities in this chapter
builds on 6\textsuperscript{th} grade understandings where students were introduced to inequalities represented on a number line. In this chapter student move to solving simple one-step inequalities. Also by this chapter, students should move to representing ideas symbolically rather than with models.

\textbf{Future Knowledge}

Throughout mathematics, students need to be able to model a variety of contexts with algebraic expressions and equations. Further, algebraic expressions help shed new light on the structure of the context. Thus the work in this chapter helps to move students to thinking about concrete situations in more abstract terms. Lastly, by understanding how an unknown in an expressions/equations can represent a “fixed” quantity, students will be able to move to contexts where the unknown can represent variable amounts (i.e. functions in 8\textsuperscript{th} grade.)
**MATHEMATICAL PRACTICE STANDARDS (emphasized):**

<table>
<thead>
<tr>
<th>Make sense of problems and persevere in solving them.</th>
<th>Students must read, interpret and understand problem situation and transfer that understanding to algebraic equations or inequalities that represent the context. Students should develop flexible strategies for doing this work that will extend to more complicated situations. Additionally, students should make reasonable predictions about what they believe their final answer will be and then use that to both guide their strategy for writing expressions and equations and for checking their answer.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reason abstractly and quantitatively.</td>
<td>Students should fluidly connect problem contexts to algebraic representations of them. Each portion of the expression (e.g. variables, operations, groupings etc.) should connect to the context and the abstract representation should shed new light on context.</td>
</tr>
<tr>
<td>Construct viable arguments and critique the reasoning of others.</td>
<td>Students are able to explain and defend the reasonableness of their answer by connecting the context to the abstract representation. Further, students should be able to critique the work of others by connecting the context to the algebraic expression and/or equation.</td>
</tr>
<tr>
<td>Model with Mathematics.</td>
<td>Students will model a variety of contexts with algebraic expressions and equations. Further, students should be able to take an algebraic expression or equation and model it with a context.</td>
</tr>
<tr>
<td>Attend to Precision</td>
<td>Students should use precision in translating between contexts and abstract representations. For example, students should understand when two expressions should be “equal” versus “greater than or equal to” each other OR distinguish when a quantity is being “increased by two” versus “increased by a factor of two.”</td>
</tr>
<tr>
<td>Look for and make use of structure</td>
<td>Students should recognize and interpret structures both within a context and an algebraic expression/equation. Structures either in contexts or in abstract representations should shed light on how to solve a problem and the reasonableness of an answer.</td>
</tr>
<tr>
<td>Use appropriate tools strategically.</td>
<td>Students demonstrate their ability to select and use the most appropriate tool (paper/pencil, manipulatives, pictorial models and calculators) while solving real-life word problems. By this chapter, students should recognize that their ability to reason though computations is often much faster than using a calculator.</td>
</tr>
<tr>
<td>Look for and express regularity in repeated reasoning</td>
<td>Students look for structure and patterns in real-life contexts to help them identify solution strategies. Further, students should begin to recognize how things are changing in a context (operationally.) In 7th grade the change is fixed and equations help us find one unknown but in 8th grade students begin to understand change can be continuous (as in functions) and they begin to see how an unknown can represent a variable quantity.</td>
</tr>
</tbody>
</table>
Section 6.1 Write and Solve Equations to Find Unknowns in Geometric Situations.

Section Overview: This section builds upon what students learned about geometric relationships in chapter 5 and in earlier grades. Students start with a review of solving equations. They then move to applying those skills to writing and solving one-step and multi-step equations involving finding missing measures of unknown values in contexts involving various angle relationships with triangles, areas, perimeters, circles and scaling. Students should pay close attention to the relationship between the structure of algebraic equations and expressions and the contexts they represent.

Concepts and Skills to be Mastered (from standards)

By the end of this section, students will be able to:
1. Use properties of supplementary, complementary, vertical, and adjacent angles to solve for unknown angles in figures.
2. Write and solve equations based on a diagram of intersecting lines with some known angle measures.
3. Write and solve equations to find the measure of a missing angle in a triangle.
4. Write and solve equations to find the radius or diameter given the area or circumference of a circle.
5. Write and solve equations using a scale factors.
6. Write and solve equations to find areas, perimeters, or unknown lengths of polygonal figures.
Class Activity: Solving Equations Review

In Chapter 3, you learned to solve various equations using models. If necessary, use the Key to draw a model to solve the following equations:

Key for Tiles:

<table>
<thead>
<tr>
<th>1</th>
<th>= 1</th>
</tr>
</thead>
<tbody>
<tr>
<td>x</td>
<td>= x</td>
</tr>
<tr>
<td>-x</td>
<td>= -x</td>
</tr>
</tbody>
</table>

The exercises below should be review, but students may still not be entirely confident in their ability. It is important that students master solving basic linear equations. For exercises involving fractions, encourage students to clear fractions with multiplication. For example, #4 is made easier by multiplying each side of the equation by 2. Your students may not need to use tiles any longer, that’s fine. However, students should show all work. Discuss properties of arithmetic throughout.

<table>
<thead>
<tr>
<th>Model the Equation</th>
<th>What are the solving action?</th>
<th>Record the steps using Algebra</th>
<th>Check solution in the equation.</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. $2x + 7 = 9$</td>
<td>Add $-7$ to both sides.</td>
<td>$2x + 7 = 9$</td>
<td>$2(1) + 7 = 9$ $2 + 7 = 9$ $9 = 9$</td>
</tr>
<tr>
<td></td>
<td>Divide by 2 on both sides.</td>
<td>$2x + 7 - 7 = 9$</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>$x = 1$</td>
<td></td>
</tr>
</tbody>
</table>

| 2. $-7 = 3x - 1$  | Add 1 to both sides.        | $-7 + 1 = 3x - 1 + 1$        | $-7 = 3(-2) - 1$ $-7 = -6 - 1$ $-7 = -7$ |
|                    | Divide by 3 on both sides.  | $-7 + 1 = 3x - 1 + 1$        |                                |
|                    |                             | $x = -2$                      |                                |

| 3. $0 = 3 - 7x + 10$ | Add 7x to both sides.       | $0 = 3 - 7(1/7) + 10$        | $0 = 3 - 7(13/7) + 10$ $0 = 3 - 13 + 10$ $0 = 10 + 10$ $0 = 0$ |
|                      | Add 3 and 10 on the right side. | $0 = 3 - 7(13/7) + 10$        |                                |
|                      | Divide both sides by 7.      | $x = (13/7)$                  |                                |

x = (13/7)
4. \((1/2)(3x - 4) = -8\)

\[
\begin{align*}
\frac{1}{2}(3x - 4) &= -8 \\
\frac{1}{2}(-12 - 4) &= -8 \\
-8 &= -8
\end{align*}
\]

Multiply both sides by 2. Add 4 to both sides. Subtract x from both sides. Divide by 5 on both sides.

\[x = -4\]

5. \((1/3)x - 6 = 2x + 1\)

\[
\begin{align*}
\frac{1}{3}(x - 6) &= 2x + 1 \\
\frac{1}{3}(-18 - 6) &= 2x + 1 \\
-8 &= 2x + 1 \\
2x &= -9 \\
x &= -\frac{9}{2}
\end{align*}
\]

Multiply both sides by 3. Subtract 3 from both sides. Subtract x from both sides. Divide by 5 on both sides.

\[x = -21/5\]

Solve the following either with or without a model.

6) \(1 = 5x + 7 - 2x\)

\[x = -2\]

7) \(-10 = (1/2)x - 3\)

\[x = -14\]

8) \((2/3)x + 4 = -2 + x\)

\[x = 18\]

9) \(14 = -2(3x + 1)\)

\[x = -8/3\]

10) \(-5 = (1/2)(3x - 1)\)

\[x = -3\]

11) \((-1/3)(2x + 5) = 7\)

\[x = -13\]
Homework: Solving equations review.

Solve the following equations. Draw a model if needed. Show all steps using Algebra. A calculator may be helpful.

1. $5x + 3 = -2$
   
   $x = -1$

2. $34 = -2(1 - 9x)$
   
   $x = 2$

3. $2(3x - 3) - 8 = 4$

4. $= 5$

5. $7x - 7 - 4 = -25$

6. $6(b - 5) = 30$

7. $2j - 6 - \frac{1}{2}j = -12$

8. $8(v + 1) = 4$

   $v = -1/2$

9. $2b - \frac{1}{9} = \frac{1}{3}$

10. $-5 + 75n + 1 = 146$

    $n = 2$

11. $357 = 3(x - 9)$

12. $48 = 15 + \frac{1}{3}d$

13. $48 - \frac{1}{3}d - \frac{2}{3}d = 50$

    $-2 = d$

14. $8y + \frac{2}{3} = 9$

15. $0.75n + 1 - 0.25n = -100$

    $n = -202$
6.1a Class Activity: Complementary, Supplementary, Vertical, Adjacent Angles

Review: Chapter 5 concepts: Encourage students to look back at chapter 5 for additional support.

Draw an example for each type of angle pair then explain their relationship.

<table>
<thead>
<tr>
<th>1. Complementary Angles</th>
<th>2. Supplementary Angles</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image1" alt="Complementary Angles" /></td>
<td><img src="image2" alt="Supplementary Angles" /></td>
</tr>
<tr>
<td>The sum of the angles is 90°. Note: <strong>angles do not need to be adjacent.</strong> Draw both ways.</td>
<td>The sum of the angles is 180°. Again, they <strong>do not need to be adjacent.</strong></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image3" alt="Vertical Angles" /></td>
<td><img src="image4" alt="Adjacent Angles" /></td>
</tr>
<tr>
<td>Formed by intersecting lines. Opposite angles have the same measure.</td>
<td>Two angles that share a common ray and vertex.</td>
</tr>
</tbody>
</table>

 Identify whether the example pairs below are complementary, supplementary or neither.

<table>
<thead>
<tr>
<th>5.</th>
<th>6.</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image5" alt="Complementary" /></td>
<td><img src="image6" alt="Complementary" /></td>
</tr>
<tr>
<td>Complementary</td>
<td>Complementary</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>7.</th>
<th>8. Angle A = 37°, Angle B = 53°</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image7" alt="Supplementary" /></td>
<td><img src="image8" alt="Supplementary" /></td>
</tr>
<tr>
<td>Supplementary</td>
<td>Complementary</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>9. Angle C = 110°, Angle B = 70°</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image9" alt="Supplementary" /></td>
</tr>
</tbody>
</table>
Find the measure of the identified angle:

<table>
<thead>
<tr>
<th>10.</th>
<th>11.</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="Image of angle 70°" /></td>
<td><img src="image" alt="Image of angle 33°" /></td>
</tr>
<tr>
<td>70°, vertical</td>
<td>33°, vertical</td>
</tr>
</tbody>
</table>

Are the angles in #10 adjacent or vertical? Explain: **Vertical**, formed by intersecting lines, opp. angles have the same measure.

Are the angles in #11 adjacent or vertical? Explain: **Vertical**

<table>
<thead>
<tr>
<th>12.</th>
<th>13.</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="Image of angle 123°" /></td>
<td><img src="image" alt="Image of angle 55°" /></td>
</tr>
<tr>
<td>Adjacent or vertical? <strong>Adjacent</strong>, common ray and vertex.</td>
<td>Adjacent or vertical? <strong>Adjacent</strong></td>
</tr>
</tbody>
</table>

In 10-13 above the adjacent angle pairs are also examples of supplementary angles. Are adjacent angles always supplementary? **No**, have students draw a counter example.

Also, begin to talk about simple equations. For example, #12 can be written as: B + 123 = 180 or 180 – 123 = B. In other words, you're beginning to discuss modeling with mathematics.
Use angle relationship (complementary, supplementary, vertical) to write a simple equation to find the missing angle (example: $180^\circ = 50^\circ + x$, or $x = 180^\circ - 50^\circ$)

<table>
<thead>
<tr>
<th>14.</th>
<th>15.</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image1.png" alt="Diagram" /></td>
<td><img src="image2.png" alt="Diagram" /></td>
</tr>
<tr>
<td>Equation involving $M$: $90^\circ = 65^\circ + M$, $M = 90^\circ - 65^\circ$</td>
<td>Equation involving $M$: $180^\circ = M + 95^\circ$, $180^\circ - 95^\circ = M$</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>16.</th>
<th>17.</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image3.png" alt="Diagram" /></td>
<td><img src="image4.png" alt="Diagram" /></td>
</tr>
<tr>
<td>Equation involving $M$: $90^\circ = M + 33^\circ$, $M = 90^\circ - 33^\circ$</td>
<td>Equation involving $M$: $180^\circ = 39^\circ + M$, $M = 180^\circ - 39^\circ$</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>18.</th>
<th>Write equations for $a$, $b$, and $c$ below:</th>
</tr>
</thead>
</table>
| ![Diagram](image5.png) | $a \rightarrow a = 180^\circ - 73^\circ$  
  or $a + 73^\circ = 180^\circ$  
  $b \rightarrow b = 73^\circ$  
  $c \rightarrow c = 180^\circ - 73^\circ$  
  or $73^\circ + c = 180^\circ$ |

Discuss the structure of equations involving vertical, supplementary and complementary angles.
For 19-25 draw a model to help you find the measure of the indicated angle.

<p>| | |</p>

</tbody>
</table>
6.1a Homework: Complementary, Supplementary, Vertical, Adjacent Angles

For numbers 1-6, use angle relationship (complementary, supplementary, vertical) to write a simple equation to find the missing angle. Then find the measure of the missing angle.

1. \[ M = 90^\circ - 32^\circ \]
   \[ M = 58^\circ \]

2. \[ M = \]

3. \[ M = \]

4. \[ M = 180^\circ - 36^\circ \]
   \[ M = 144^\circ \]

5. \[ M = \]

6. \[ M = \]
For each of the following: a) write an equation to find the missing angles and b) find the missing angle.

<table>
<thead>
<tr>
<th>7. Find the measure of an angle whose complement is 20°.</th>
<th>8. Find the measure of an angle whose supplement is 121°.</th>
</tr>
</thead>
<tbody>
<tr>
<td>M = 90° - 20°</td>
<td></td>
</tr>
<tr>
<td>M = 70°</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>9. Two angles are supplementary, and they are equal. What are the measures of the two angles?</th>
<th>10. Two angles are complementary. One angle is 4 times the size of the other angle. What are the measures of the two angles?</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>90° = 4M + M</td>
<td></td>
</tr>
<tr>
<td>M = 18°</td>
<td></td>
</tr>
<tr>
<td>4M = 72°</td>
<td></td>
</tr>
</tbody>
</table>

Determine if the statement below is always, sometimes or never true. If it is sometimes true, give an example when it is true and when it is false. If it never true, give a counter example.

11. Adjacent angles are also supplementary angles. Sometimes true

12. Vertical angles are complementary angles.

13. If one of two adjacent angles is 70°, then the other is also 70°.

14. Vertical angles have the same measure.

15. Perpendicular lines will never intersect. Never true
Spiral Review

1. Solve \(6x + 4 = 2\). \(x = 1\)

2. Simplify the following expression. Use a model if needed.
   \[18m + 8 \quad 12m \quad 30m + 8\]

4. If \(A\) is complementary to \(F\) and \(m\ A = 79^\circ\), what is \(m\ F\)?
   \[m\ F = 11^\circ\]

4. You can buy 8 apples for $2.00.
   a. Find the unit rate for 1 apple. \$0.25 per apple.
   b. Find the unit rate for $1. \(4\) apples per dollar.

5. Is this graph proportional? \(\text{no}\)
   
   How do you know? \(\text{It does not have a consistent unit rate.}\)
6.1b Class Activity: Angle Pairs and Solving Equations

To begin: Talk in a group about your answers to numbers 11-15 from homework 6.1a. Present your arguments to the class.

Review: Solve each of the equations below:

1. \(3x + 1 = x - 5\) \(x = -3\)

2. \(14 = 5 - 3x\) \(x = -3\)

3. \(13 = 2(x - 1) + 1\) \(x = 7\)

4. \((2x + 3) + (x - 1) = 17\) \(x = 15\)

For each situation below, write an equation and then find the missing angles.

5. Angle ABC is a right angle.
   - Equation: \(x = 90° - 50°\) 
   - DBC = 40°

6. Figure ABC is a straight line.
   - Equation: \(x = 180° - 24°\) 
   - ABK = 156°

7. Given the \(m_1 = (3x + 2)\) and the \(m_3 = (2x - 7)\).
   - Equation: \(180° = (2x - 7) + (3x + 2)\)
   - \(x = 37°\) 
   - \(1 = 113°\) \(3 = 67°\) \(2 = 113°\) \(4 = 67°\)

8. Find the values of \(x\) and \(y\) in the following figure.
   - Equation: \(2x = 70°\), \(2x + y + 70 = 180°\); substitute 70 for \(2x\); \(140° + y = 180°\)
   - \(x = 35°\) \(y = 40°\)
   - ACD = 70° \(ACE = 110°\) \(DCB = 110°\)
<table>
<thead>
<tr>
<th>Problem</th>
<th>Equation</th>
<th>Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.</td>
<td>A pair of angles are equal. Their sum is 144°. Find the angle measure.</td>
<td>( x = 72° )</td>
</tr>
<tr>
<td>10.</td>
<td>Two adjacent angles (A and B) are in the ratio of 4:5. The sum of the angles is equal to 54°. Find the angle measures.</td>
<td>A = 24°, B = 30°</td>
</tr>
<tr>
<td>11.</td>
<td>R and W are adjacent. R is 30° larger than W. Their sum is 70°. Find the angle measures.</td>
<td>(&lt;R = 50°), (&lt;W = 20°)</td>
</tr>
<tr>
<td>12.</td>
<td>A and B are supplementary angles whose ratio is 2:3. Find the angle measures.</td>
<td>(&lt;A = 72°), (&lt;B = 108°)</td>
</tr>
<tr>
<td>13.</td>
<td>One supplementary angle is 15 degrees less than twice the other. Find the measure of the two supplementary angles.</td>
<td>65°, 115°</td>
</tr>
<tr>
<td>14.</td>
<td>Angles A and B together create a 90° angle. ( A = 4x ) 10 and ( B = 2x ) 20. Find the angle measures.</td>
<td>(&lt;A = 70°), (&lt;B = 20°)</td>
</tr>
</tbody>
</table>
Use the diagram to the right for 15 and 16.

15. Given $IL \perp NK$.

Name two complementary angles: $\angle INJ, \angle JNK$

Name two supplementary angles: $\angle INK, \angle KNL$

$\angle INM, \angle MNL, \angle JNK, \angle KNM$

$\angle JNL, \angle LNM$

16. Given: $m\angle MNL = 70^\circ$. Find the measures of the following angles:

$m\angle JNK = 20^\circ$

$m\angle JNL = 130^\circ$

Explain how you arrived at your answer: the measure of $\angle MNL$ is equal to the measure of $\angle INJ$ because they are vertical angles. $\angle INK$ and $\angle JNK$ are complementary angles. $\angle MNL$ and $\angle JNL$ are supplementary angles.

17. Find the value of $x$:

$x = 17$

18. Find the value of $x$:

$x = 10.5$

19. Explain how you might check your answer for number 13 and then use the strategy to check your answer.

You can evaluate for both angles and then check to see if the sum of the two angles is 180. So,

$(5(17) – 18) + (4(17) + 45) = 180$

20. Explain how you might check your answer for number 14. The angle must equal 90, so you can check to see if $10(10.5) – 15 = 90$.

21. Make up a problem like #17 or #18 and solve it. Be prepared to share it with others.
### 6.1b Homework: Angle Pairs and Solving Equations

Solve each:

<p>| | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>4(x – 2) = -24</td>
<td>x = -4</td>

Spiral Review

1. Simplify the following expression. \(-4x + 4.5 - 0.94 + 14x\)
   \[
   10x + 3.56
   \]

2. The graph to the left shows how many hours Gabriel worked and how much he was paid. What does the point (1, 15) mean in context of the situation? Use the unit rate in your explanation.

3. Use a proportion to find what 35% of 120 is. 42

4. If \(A\) is vertical to \(F\) and \(m\ \angle A = 16^\circ\), what is \(m\ \angle F\)?
   \[
   m\ \angle F = 16^\circ
   \]

5. Solve \(41 = \frac{1}{2}x + (4)\)
   \[
   x = 90
   \]
6.1c Class Activity: Perimeter and Area with Variables

Review:
1. Find the perimeter and area of the rectangle shown below

```
  7
3
```

Perimeter: 20
Area: 21 square units

2. What is the difference between perimeter and area?
Stress units of measure and operation, i.e. perimeter is linear (one-dimensional) and found by adding while area is a squared measure (two-dimensional) and found by multiplying. You may want to review the models discussed in chapter 2 for addition and multiplication as well.
RECALL: if a rectangle’s sides are scaled by a factor of 4, then the new rectangle will have a perimeter 3 times the original and an area 16 times the original. Why is this true?

3. Find an expression for the perimeter and area of the rectangle shown below

```
  x + 4
2
```

If the perimeter is 20, what is the value of x?
Equation: 2x + 12 = 20
Solution: x = 4

If the area is 30, what is the value of x?
Equation: 2(x + 4) = 30
Solution: x = 11

4. Find an expression for the perimeter and area of the rectangle shown below

```
  y – 1
3
```

Scale this rectangle by a factor of 4. Write an expression for the scaled rectangle’s perimeter and area.
Now the rectangle is 4(y – 1) by 4(3). So:

Perimeter is 2[4(y – 1)] + 2[4(3)] or 8(y – 1) + 8(3) or 8y – 8 + 24 or 8y + 16—four times the original perimeter.
Area: 4(3) x 4(y – 1) or 16[3(y – 1)]—sixteen times the original area.
5. The perimeter of a rectangle is 48 in. Its length is twice its width.
   a) Draw a model of the context.
      
      ![Diagram of a rectangle with labels]

   b) Write an equation relating the length and width to the perimeter.
      
      \[2x + 2x + x + x = 48\]

   c) Solve the equation and state the length and width.
      
      \[x = 8\]
      
      length is 16 in.
      
      width is 8 in.

6. The area of a rectangle is 18 in². The length is \(x + 4\) and the width is 3 in. Draw a model of the context.
   a) Draw a model of the context.
      
      ![Diagram of a rectangle with labels]

   b) Write an equation relating the length and width to the area.
      
      \[3(x+4) = 18\text{ square inches}\]

   c) Solve the equation and state the length and width.
      
      \[x = 6\]
      
      length is 6 in.
      
      width is 3in.

7. A rectangular garden has an area of 48 square feet. One of the sides is currently 6.4 feet while the other is 7.5 feet.
   a) By how much would the shorter side (the 6.4 foot side) have to be increased to get a garden with an area of 60 square feet?
      
      \[7.5(6.4 + x) = 60; 1.6\text{ feet}\]

   b) How much would the longer side (the 7.5 foot side) have to be increased to get the same area (60 square feet)?
      
      \[6.4(7.5 + x) = 60; 1.875\text{ feet}\]

8. The area of a rectangular garden is 128 ft². On a map of the garden, the scale is 1/4 in. = 1 ft. What is the area of the garden on the map?
   
   128(1/4)(1/4) or 128/16; 8 square inches

   Recall: area is two dimensional, we are affecting both length and with by a scale factor of ¼. Thus, 128/(4*4)

   This may be a particularly challenging problem for some students. You may want to refer back to class activity 5.2b for 7-9. You may also want to draw a 16x8 units rectangle (thus area of 128 sq. units). Now if a scale factor of ¼ is applied, the sides will be 4x2 units and the area will be 8 square units.

9. The ratio of length to width of a rectangular photograph is 1:2. The short side is 8 units. If it is reduced by a scale factor of 1/3, what are the dimensions of the reduced photo, and what is the area of the new photograph?
   
   The dimensions are 8/3:16/3; new area is 128/9 units squared.

10. Thirty percent of a photograph is in black ink. In this particular photograph, that means 100 cm² is black ink. If the dimensions of the photo are enlarged by a factor of 3, how many square centimeters are black, and what is the area of the enlarged photograph?
   
   900 square centimeters are black. The original photo must have been 333 1/3 units sq.; so the new area is (333 1/3)(9) or 3000 units sq.

11. If the base of the rectangle below is 17x and its perimeter is 1 + 34x, a) what is the length of the vertical sides? b) find x if the area is 50.
   
   Vertical side is \(\frac{1}{2}\) units; \(x = 49/34\) units.
12. What is the perimeter of the figure to the right? **68.55 cm**

**Review circumference = 2\pi r and that \pi is approx. 3.14**

13. What is its area? **253.125 cm^2**

**Review Area = \pi r^2**

14. Find the area of the figure below: **12 mi^2**

15. The ratio of the length to width of a rectangular photograph is 2:5. The longer side is 15 inches. a) What is the length of the longer side? b) If the area of the photo is quadrupled, what will the new dimensions of the photo be? a) shorter side is 6 in. b) new dimensions 12 x 30 in. To help students see this, use grid paper to make a 6x15 rectangle, show students the area is 90 units^2. Ask them what the area would be if you quadrupled it (360 units^2.) Thus you need 4 rectangles. Draw the scaled version by making a rectangle of 12x30, showing students that the length and width both doubled. See below:
6.1c Homework: Perimeter and Area with Variables

It will be VERY helpful to draw a model of each context.

1. Find an expression for the perimeter and area of the rectangle shown below

   \[ \text{Perimeter} = 2(x - 6) + 2(4) \]
   \[ \text{Area} = 4(x - 6) \]

   If the perimeter is 60, what is the value of \( x \)?
   \[ x = 32 \]

   If the area is 80, what is the value of \( x \)?
   \[ x = 26 \]

2. Find an expression for the perimeter and area of the rectangle shown below

   \[ \text{Perimeter} = \]
   \[ \text{Area} = \]

   If the perimeter is 100, what is the value of \( x \)?

   If the area is 200, what is the value of \( x \)?

3. The perimeter of a rectangle is 64 in. Its length is three times its width. Find a) the length and width and b) the area of the rectangle.

   It is very helpful to draw the model to see the relationship between \( l \) and \( w \).
   \[ l = 3w; \ 2(3w) + 2(w) = 64 \]
   \[ \text{Length} = 24 \text{ in.}, \text{width} = 8 \text{ in.} \]
   \[ \text{A} = 192 \text{ in}^2. \]

4. The area of a rectangle is 28 in\(^2\). The length is \( x + 2 \) in. and the width is 7 in. Find a) the value of \( x \), b) the length and c) the perimeter of the rectangle.

5. The area of a rectangle is 81 cm\(^2\). The length equals the width. Find a) the length, b) the width, and c) the perimeter.

6. Challenge: What’s the biggest area you can enclose with 1000 meters of fencing? Suppose you have a horse and exactly 1000 feet of fencing. You want to create an enclosure for your horse to give it the most area to roam. How would you configure your fence.
7. The area of a rectangular garden is 224 ft\(^2\). On a map of the garden, the scale is 1 in. = 1/2 ft. What is the area of the garden on the map? 896 in\(^2\); every 1 foot of the garden is 2 inches on the scale drawing. Thus, we multiply by 4.

8. The ratio of length to width of a rectangular photograph is 3:5. The shorter side is 3 units. If the dimensions are enlarged by a scale factor of 6, a) what are the dimensions of the enlarged photo? and b) what is the area of the new photograph?
The new dimensions are 18 x 30 units. The new area is 540 units squared.

9. 20\% of a photograph is in black ink. In this particular photograph, that means 100 cm\(^2\) is black ink. If the area of the photo is enlarged by a factor of 9, a) how many square centimeters are black, and b) what is the area of the enlarged photograph?
900 cm\(^2\) are black—this is 9 times 100 cm\(^2\)
A = 4500 cm\(^2\)—20\% of the area is black, thus 900 cm\(^2\) is 20\% of total. 5x900 cm\(^2\)

10. The perimeter of a square is 4x + 6. What is its side length?

11. Find the perimeter of the figure to the right:

12. Find its area of the figure to the right:

13. Find the area of the figure below: 18 mm\(^2\)
Spiral Review

1. The length of a rectangle is 16 in. longer than the width. Represent the length of the rectangle. 
   \[ w \text{ is the width of the rectangle. Then the length is } w + 16. \]

2. What property is shown?
   \[ 8(7 + 2) = 8(2) + 8(7) \quad \text{distributive property} \]
   \[ 18 + 0 = 18 \quad \text{identity property of addition} \]

3. Determine if the given angles will make a triangle. Explain why or why not.
   a. Angles 25°, 60°, 95° \textbf{Yes}
   b. Angles 30°, 40°, 20° \textbf{No}

4. Add \(-4 + (-7) = -11\)

5. Solve \(6(1 + 8x) = 18\) \[ x = \frac{1}{2} \]
6.1d Class Activity: Triangles and Circles

In chapter 5, you worked with angle measures in triangles. Now, you are going to practice writing equations to solve for a missing angle measure. Recall from Chapter 5 that the angles of a triangle sum to 180°.

Example:
Find the missing angle measure:

Equation: 120 + 24 + x = 180
Solution: 144 + x = 180
       -144    -144
       x = 36°

Sometimes, x is not the missing angle measure:

Equation: 2x + 42 + 64 = 180
Solution: 2x + 106 = 180
       -106    -106
       2x = 74
       2       2
       x = 37

However, x is not the missing angle measure. 2x is, so the missing angle measure is 2(37°) = 74°

Write an equation and solve for x, then find the missing angle measures. *Pictures are not drawn to scale.*

1. 
   Equation: 20 + x + 90 = 180
   Solution: x = 70, angle is 70°

2. 
   Equation: 38° + x + 71° = 180
   Solution:

3. 
   Equation: 93° + 3x + 54° = 180
   Solution:

4. 
   Equation: 102° + 43° + 5x = 180
   Solution: x = 7, angle is 35°
   The value of x and the measure of the angle are NOT the same. Discuss how is problem is different than the previous ones in this section.
5. One angle of a triangle is 5 times the smallest angle. The other angle is 40°.

**Equation:** \( 5x + x + 40 = 180 \)

**Solution:** \( x = 23 \frac{1}{3} \); angles are, 116 \( \frac{2}{3} \)°, 40° and 23 \( \frac{1}{3} \)°.

6. The sum of 2 angles of a triangle is \( 37 \frac{1}{2} \)°. What is the measure of the other angle?

**Equation:** \( x + 37.4 = 180 \) or \( 180 - 37 \frac{1}{2} = x \)

**Solution:** \( x = 142 \frac{1}{2} \)

7. The ratio of angles of a triangle is 3:2:1. What are the angle measurements?

**Equation:** \( 3x + 2x + x = 180 \)

**Solution:** \( x = 30 \); angles are 90°, 60°, and 30°.

8. One of the angles of a triangle is one-fourth the size of the largest angle. The other angle is one-half the size of the largest angle. What are the measures of all the angles?

**Equation:** \( \frac{1}{4}x + \frac{1}{2}x + x = 180 \)

**Solution:** \( x = 102.86 \); angles are 25.71°, 51.43°, and 102.86°.

9. The ratio of the angles of a triangle is 5:2/3:1. What are the measures of all three angles?

**Equation:** \( 5x + \frac{2}{3}x + x = 180 \)

**Solution:** \( x = 27 \); angles are 135°, 18°, and 27°.

10. One angle of a triangle is 63°. The ratio of the other two angles is 5:2. What are the measures of all the angles of the triangle?

**Equation:** \( 63 + 5x + 2x = 180 \)

**Solution:** \( x = 16.71 \); angles are 63°, 83.57°, and 33.43°.

11. The angle of a triangle is 54°. The ratio of the other two angles is 3:5. What are the measurements of all the triangles.

**Equation:**

**Solution:**

12. Two angles of a right triangle have the ratio 5:7. What are the measures of the angles?

**Equation:** \( 90 + 5x + 7x = 180 \)

**Solution:** \( x = 7.5 \); angles are 90°, 37.5°, and 52.5°.

Now for circles:

Review: What is the formula for the **Circumference** of a circle? \( C = 2\pi r \) or \( C = d\pi \)

What is the formula for the **Area** of a circle? \( A = \pi r^2 \)

13. What if you were only given the circumference? Could you find the radius or diameter? Yes, \( r = \frac{C}{2\pi}, \ d = 2r \)
14. Michael loves swimming. He swam around the edge of a circular pool and found that it took him 176 strokes to swim one complete time around the pool. About how many strokes will it take him to swim across the pool? (Use 3.14 for pi) About 55 strokes. Ask students to explain why they divided 176 by 3.14. Remind students that the circumference of a circle is always pi times the diameter.

15. The circumference of the center circle of a soccer field is 31.416 yards. What is the radius of the circle? 
   Equation: 31.416 = 2πr
   Solution: the radius is about 5 yards

16. Find the radius of a circle with a circumference of 22 feet. Students will need to use calculators, however ask them to estimate their answers before they use their calculator.
   Equation: 22 = 2πr; Students should understand that r = 11/π. Hence 11 divided by a little more than 3, so their answer will be somewhere between 3 and 4.
   Solution: r ≈ 3.5ft

17. A farmer has a 100 feet x 100 feet plot of land he needs to water. He has a sprinkler that waters in a circle. The sprinkler has a reach of 50 feet. If he puts the sprinkler in the center of the plot of land, what percent of the plot will be watered? (Hint: Draw a picture first) about 78.5%; 50²(3.14)/100². Note, students do not have the figure below. Tell them to create a model of the situation.

18. Pizzas are sold according to diameter. For example, a 6 inch pizza is a pizza with a diameter of 6 inches. At Francesco’s pizzeria, there are two pizzas. Pizza A is a 12 inch, and Pizza B has an area of 450 in². Which pizza is bigger? What is the percent of increase from the smaller pizza to the larger pizza? Pizza B is bigger. The percent of increase is 298%

19. A bike’s wheel diameter is 50 cm. If the wheel rotates 45 times a minute, how far has the bike traveled after 30 minutes? 211,950 cm

20. Mary has a circular table whose diameter is 7 feet. She would like to put a tablecloth on it, but the packaging only gives the area. The tablecloth she bought says it is 110 ft². Will the tablecloth fit? The area is 38.47 ft² so the tablecloth will fit.

</tbody>
</table>
Sample Problems for Section 6.1

1. Find the measure of the missing angle.

   a. Find the measure of an angle whose complement is 48.4°.

   b. Find the measure of an angle vertical to a 94° angle.

   c. Two angles are complementary. One angle is 4 times the measure of the other angle. What are the measures of the two angles?

2. Find the measure of the missing angles in each diagram by first writing an equation:

   a. 

   b.

3. Write an equation to solve the following problems.
   a. Terry is building planter boxes for his garden. He wants each box to have an area of 12.5 ft$^2$. If each box is 5 feet wide, how long should he make them?
   
   b. If the perimeter of rectangle to the right is 144, what is the value of $t$?
   
   c. If the area of the rectangle to the right is 52, what is the value of $t$?

4. Find the missing angles in each triangle drawn or described below.
   
   a. 
   
   b. A triangle has the following angles: 37° and 53°. What is the measure of the third angle?
   
   c. One angle in a triangle is 90°. The ratio of the other two angles is 1:8. What is the measure of each angle?
   
   d. 

©2014 University of Utah Middle School Math Project in partnership with the Utah State Office of Education. Licensed under Creative Commons, cc-by.
5. Write an equation to solve the following problems involving circles:
   
a. The circumference of Fabian’s watch is 125.6 mm. What is the diameter of his watch?
   
b. General Sherman is a giant sequoia tree in California. The largest in the world, its circumference is 102.6 feet. What is its diameter?
   
c. The circumference of a carousel is 21.98 yd. What is the area of ground covered by the carousel?
   
d. Everlie buys a take-and-bake pizza. The area of the pizza is 154 in\(^2\). Her pizza pan to bake it on has a 16 in. diameter. Will the pizza fit on her pan?
Section 6.2 Write and Solve Equations from Word Problems

Section Overview:
This section begins with a review of solving multi-step equations, both with and without models, within a context. Students then build on that understanding to work with more complicated situations. Activities in this section have students working in two “different directions”—in some sections students will be given a context and asked to find relationships and solutions, while in other sections, students will be given relationships and asked to write contexts. The goal is to help students understand the structure of context in relationship to algebraic representations.

Concepts and Skills to be Mastered

By the end of this section, students should be able to:
1. Recognize and explain the meaning of a given expression or equation and its component parts.
2. Solve multi-step context problems involving calculations with positive and negative rational numbers in a variety of forms.
3. Use variables to create equations that model word problems.
4. Solve word problems leading to linear equations.
Anchor Problem: Cookies for a Party

I go to the store to buy cookies, milk, napkins, and cups for a party. I need to know how many packages of cookies I can buy and still have money left over. I have $35.50 in my wallet. I know that I need 2 packages of napkins at $1.50 each and two packages of cups at $3.50 each. I need one gallon of milk for every two packages of cookies. Each gallon of milk costs $2.50. Each package of cookies costs $3. How many packages of cookies can I buy and still have money left over? You can buy 6 packages of cookies and 3 gallons of milk but you would have no money left over. If you want money left over, then you should buy 4 packages of cookies and only 2 gallons of milk.
# 6.2a Class Activity and Homework: Write and Solve Equations for Word Problems I

In the exercises below you are given either a context/word problem OR a model/equation. Provide the missing information. Solve each problem. An example is given.

<table>
<thead>
<tr>
<th>Word Problem</th>
<th>Model and/or equation</th>
<th>Solution</th>
</tr>
</thead>
</table>
| **EXAMPLE**  | Three times some number plus one is seven. What is the number? | \[
x \times x \times 1 = 1 \\
3x + 1 = 7
\] | \[
x = 2
\] |
| 1) Four times a number increased by 2 is 30. What is the number? | \[
4x + 2 = 30
\] | \[
x = 7
\] |
| 2) Eleven less than 5 times a number is 24. | | |
| 3) The quotient of a number and -9 is increased by 10 the result is 11. | \[
\frac{x}{-9} + 10 = 11
\] | \[
x = -9
\] |
| 4) The sum of a number and twice that number is 36. What is the number? OR The ratio of red marbles to blue marbles is 1 to 2. If there are 36 marbles in the bag, how many are red? | \[
x + 2x = 36
\] | \[
x = 12
\] |
### For the next set of exercises, write contexts that are more “real life”.

**Example:** For two months in a row I made the same amount babysitting. I deposited my babysitting money into my savings account that had $80, I now have $350 in my account. How much money did I make each month babysitting?

\[ 2x + 80 = 350 \]

**Answers will vary, example:** Maria earned the same amount of money for three weeks at her job. She spent $70 on her phone bill and now has $260 left over. How much does she make each month?

\[ 3x - 70 = 260 \]

**Answers will vary, example:** Paulo spent \( \frac{2}{3} \) of his savings on a new phone and then spent $20 on a new cover for it. He now has $280 left in his savings account. How much money did he start with?

\[ \left( \frac{2}{3} \right) x - 20 = 280 \]

\[ x = 110 \]

\[ (2/3)x - 20 = 280 \]

\[ x = 110 \]

\[ x/2 - 5 = 10 \]

\[ x = 25 \]

\[ (2/3)x - 20 = 280 \]

\[ x = 110 \]
<table>

<tr>
<th>Question</th>
<th>Equation</th>
<th>Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>10) Answers will vary, example: The ratio of girls to boys on the track team is 3 to 2. If there are 85 people on the team, how many girls and boys are there?</td>
<td>$3x + 2x = 85$</td>
<td>51 girls and 34 boys</td>
</tr>
<tr>
<td>11) Answers will vary, example: The length of a rectangle is 3 more than the width. If the perimeter is 34, what are the length and width?</td>
<td>$x + (x+3) + x + (x+3) = 34$</td>
<td>width is 7, length is 10</td>
</tr>
<tr>
<td>12) Answers will vary, example: In a triangle, the ratio of the three angles is 1 to 3 to 5. What is the measure of each angle?</td>
<td>![Diagram](attachment:triangle angles.png)</td>
<td>$20^\circ$, $60^\circ$, $100^\circ$</td>
</tr>
<tr>
<td>13)</td>
<td>$(2/5)x + (1/5)x = 360$</td>
<td></td>
</tr>
<tr>
<td>14) Answers will vary, example: In the last year Milo’s saving account has increased by 20%. If he now has $240, how much did he start with?</td>
<td>$0.2x + x = 240$</td>
<td>$x=200$</td>
</tr>
</tbody>
</table>
Spiral Review

1. Write an expression to model the following situation in two difference ways: The price of the car was reduced by 15%.

Possible answers include: $c - 0.15c$, $0.85c$, $c(1 - 0.15)$

2. Juliana bought 3 bags of chips and 3 sodas for herself and two friends. The chips were $0.85 a bag. Write an equation to find the price of each can of soda if she spent a total of $6, then solve. $1.15$

3. Simplify the following expression.

$$71b + 4a + 4b + 4a$$

4. Solve: $7 = 3x - 2$ $x = 3$

5. Write a context for the following expression: $26 + 8x$
6.2b Class Activity and Homework: Write Word Problems for Equations I

Working backwards, writing the word problems for the equations. The first one is done for you.

<table>
<thead>
<tr>
<th>Given Information &amp; Equation</th>
<th>Write a word problem to go with the information and the equation to the left.</th>
<th>Solve the equation. Then figure out all missing information.</th>
</tr>
</thead>
</table>
| 1. Given information:  
  - \( a = \text{Ali’s age now} \)  
  - \( 2a - 3 = \text{Mel’s age now} \)  
  Equation: \( a + 2a - 3 = 39 \) years | The sum of Ali and Mel’s age is 39. If Mel is 3 years younger than twice Ali’s age, how old are Ali and Mel? | \( a = 14 \)  
  Ali is 14 and Mel is 25 |
| 2. Given information:  
  - \( s = \text{small angle} \)  
  - \( 4s = \text{larger angle} \)  
  Equation: \( s + 4s = 70 \) degrees | The sum of two angles is 70 degrees. The larger angle is 4 times bigger than the smaller angle. What is the measure of the two angles? | \( s = 14 \)  
  the angles are 14 degrees and 56 degrees. |
| 3. Given information:  
  - \( w = \text{width of rectangle} \)  
  - \( 2w + 3 = \text{length of rectangle} \)  
  Equation: \( w + 2w + 3 + w + 2w + 3 = 78 \) in. | | |
| 4. Given information:  
  - \( v = \text{Vicki’s money} \)  
  - \( 5v = \text{Wally’s money} \)  
  Equation: \( 5v + v = $72 \) | | |

13. Given information:
   - \( x \) = length of blue ribbon
   - \( 2x + 3 \) = length of red ribbon
   - \( 3x - 1 \) = length of green ribbon

   Equation: \( x + 2x + 3 + 3x - 1 = 92 \) inches

   There is a blue, red, and green ribbon. The red ribbon is 3 inches more than twice the length of the blue ribbon. The green ribbon is one inch less than 3 times the length of the blue ribbon. What is the length of each ribbon?

   \( x = 15 \)
   - Blue ribbon is 15 inches
   - Red ribbon is 33 inches
   - Green ribbon is 44 inches

14. Given information:
   - \( x \) = Amount of money Jaime earned
   - \( \frac{1}{5} x \) = one-fifth of the money Jaime made.
   - \( \frac{2}{5} x \) = two-fifths of the money Jaime made.

   Equation: \( \frac{1}{5} x + \frac{2}{5} x = $165 \)

   \( x = 15 \)
   - Blue ribbon is 15 inches
   - Red ribbon is 33 inches
   - Green ribbon is 44 inches
Spiral Review

1. Solve:
   a. \(-14 = 3x - 2\) \(\Rightarrow x = -4\)
   b. \(-8 = -3m + 10\) \(\Rightarrow m = 6\)

2. Write an expression to represent the following situation. Danielle is having a birthday party and inviting 8 friends. She wants to give each friend a gift bag with a large candy bar and a notebook. Show the total price if each large candy bar costs $1.40. \(8(1.40 + x)\)

3. Use the distributive property to rewrite the following expression \(-4(5x - 1)\) \(-20x + 4\)

4. Express each percent as a fraction in simplest form.

   \[
   \begin{align*}
   44\% & \quad \frac{44}{100} = \frac{11}{25} \\
   17.5\% & \quad \frac{175}{1000} = \frac{7}{40}
   \end{align*}
   \]

5. Malory got a 75% on her math test. To earn that score, she got 27 questions correct. Write an equation to find how many questions were on the test. Then solve. \(36\)
6.2c Class Activity: Write and Solve Equations for Word Problems II

1) Matt, Rosa, and Kathy are cousins. If you combine their ages, they would be 40 yrs. old. Matt is one-third of Rosa's age. Kathy is five years older than Rosa. How old are they? Show several ways to solve the problem. Be able to explain how you came to your answer.

a) If necessary, use a model to help you write an equations for this context.

<table>
<thead>
<tr>
<th>Rosa</th>
<th>Matt is 1/3 Rosa’s age so Matt is x/3</th>
<th>Kathy is five years older than Rosa so Kathy is x + 5</th>
</tr>
</thead>
</table>

Write an equation for the sum of the cousin’s ages: \( x + \frac{x}{3} + (x + 5) = 40 \)

Find \( x \):

\( x = 15 \)

b) How old is Rosa? 15

c) How old is Matt? 5

d) How old is Kathy? 20

e) How can you be sure you have the correct answer? Evaluate the equation in “a” for \( x = 15 \)

2) The senior class has 412 students. They are assigned to different homerooms. There are 28 students in the smallest home room and the remaining 12 homerooms have the same number of students. How many students are in each of the remaining 12 homerooms?

a) If necessary, use a model to help you write an equations for this context.

\[ 12x + 28 = 412 \]

b) How many students are in each of the 12 remaining homerooms? 32 students

c) How do you know your answer is correct? Evaluate your original equation for \( x = 32 \)
3) Billy is three years older than his sister Anne. Together, the sum of their ages is 25. How old are Billy and Anne?

a) Write an equation for this context. Use a model to help you if necessary. \( x + x + 3 = 25 \)

b) How old is Billy? 14

c) How old is Anne? 11

d) Show that your answer is correct. Evaluate your original equation for \( x = 11 \)

4) At the store, you find a pair of jeans and a t-shirt. Together, they’ll cost $80.20. The jeans cost three times the cost of the t-shirt. How much does each cost?

a) Use a model to help you write an equation for this context. \( 3x + x = 80.20 \)

b) How much do the jeans cost? $60.15

c) How much does the t-shirt cost? $20.05

d) How do you know your answer is correct? Evaluate your original equation for \( x = 20.05 \)
5) The sum of two numbers is 41. The larger number is 1 more than 5 times the smaller number. What are the two numbers?

a) Use a model to help you write an equation for this context. \((5x + 1) + x = 41\)

b) What are the two numbers? \(6 \frac{2}{3}, 34 \frac{1}{3}\)

c) How do you know your answer is correct? Evaluate your original equation for \(x = 6 \frac{2}{3}\)

6) The sum of three consecutive integers is 21. What are the numbers?

a) Use a model to help you write an equation for this context. \(n + (n + 1) + (n + 2) = 21\)

first number = \(n\)
next number = \(n + 1\)
next numbers = \(n + 2\)

*some students may think, “I know 7 + 7 + 7 is 21 (or 21/3 is 7). So the consecutive numbers must by 6, 7, 8 because they average to 7.” This is great thinking, don’t discourage it.

b) What are the three numbers? 6, 7, 8

c) How do you know your answer is correct? Evaluate your original equation for \(n = 6\)
### 6.2c Homework: Write and Solve Equations for Word Problems II.

Write equations for the word problems below. Then solve. If necessary, draw a model.

10. The total cost of a suit and 4 ties is $292. The suit cost $200. The ties are all the same price. What is the cost of a tie?
   Equation:
   Solution:

11. Mary’s sister is 7 years older than Mary. Their combined ages add up to 35. How old is Mary?
   Equation:
   Solution:

12. If Cassandra had 8 more dollars, she could buy the $40 pair of hiking boots she wants. How much money does Cassandra have?
   Equation:
   Solution:

13. Tammy is training for a marathon. She ran the 3 miles from home to a lake, twice around the lake and then home again. She ran 11 miles. How far is it around the lake?
   Equation: \(3 + 2x = 11\)
   Solution: \(x = 4\), it is 4 miles around the lake
Spiral Review

1. Solve $4(x+1) + 4x = 36 \quad x = 4$

2. Phoebe has $10. Write an expression showing how much money she will have left after buying 3 candy bars and a pack of pencils. $10 - 3c - p \quad or \quad 10 - (3c + p)$

3. Simplify $2(x + 1) - x + 5 \quad 3x + 3$

4. Find each sum without a model.
   a. $-27.2 + \frac{4}{5}$
   b. $98.1 + (-1.35)$

5. I go to a department store with a coupon for 20% off any one item. The shoes that I want are on sale for 40% off. Write and solve an equation to find the original price if I paid $48. $100$
6.2d Class Activity: Write and Solve Equations from Word Problems III

Do the following four things for each problem:
   a. Write the equation as complete as possible to include all the information.
   b. Solve the equation.
   c. Answer the question(s) in complete sentences.
   d. Check. Does your answer(s) make sense? Why?

1. For a field trip, 331 students went to the museum. Most of the students rode on the 6 buses provided by the school, but 7 students traveled in cars. If the same number of students rode each bus, how many students were in each bus?
   - a. 6x + 7 = 331
   - b. x = number of students per bus
   - c. 54 students rode each bus.
   - d. 6(54) + 7 = 331
     - 331 = 331
     It makes sense that 54 students rode each bus because a bus can easily hold that many students, but a car could not.

2. Ivan was broke (as usual!) Then he got his weekly allowance, but because he has a hard time saving money, he spent half his weekly allowance playing mini-golf. He then earned 4 dollars cleaning out his parents’ car. If he now has $12, how much is his weekly allowance?
   - a. (1/2)x + 4 = 12
   - b. x = Ivan’s allowance
     x = 16
   - c. Ivan’s weekly allowance is $16
   - d. 16/2 + 4 = 12 true, $16 makes sense as allowance.

3. The cooking club made some pies to sell to raise money for new math books. The cafeteria contributed four pies to those made by the club. All of the pies were then cut into five pieces each and sold by the piece. There were a total of 60 pieces to sell. How many pies did the club make?
   - a. 5(4) + 5x = 60
   - b. x = number of pies the club made
     x = 8
   - c. The club made 8 pies.
   - d. 20 + 5(8) = 60
4. Jan bought 2 shirts (same style and cost but different colors) and 2 pair of pants (same style and cost but different colors). Each shirt was $3 less than a pair of pants. She spent $49.80 (before tax). What is the price of a shirt? What is the price of a pair of pants?

<table>
<thead>
<tr>
<th>Expression</th>
<th>Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>a. $2(x – 3) + 2x = 49.80$</td>
<td>c. Each pair of pants costs $12.45</td>
</tr>
<tr>
<td>b. $x = \text{price of a pair of pants}$</td>
<td>d. $2(12.45 – 3) + 2(12.45) = 49.80$</td>
</tr>
<tr>
<td>$x = 12.45$</td>
<td></td>
</tr>
</tbody>
</table>

5. Tom was training for a marathon. During the first week he ran a certain distance. The second week he ran 1.5 times further than the first week. During the third and fourth weeks, he ran 3 miles more than twice what he ran the first week. He ran a total of 136 miles in those four weeks. How many miles did he run each week?

<table>
<thead>
<tr>
<th>Expression</th>
<th>Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>a. $x + 1.5x + (2x + 3) + (2x + 3) = 136$</td>
<td>c. Tom ran 20 miles week 1, 30 miles week 2, 43 miles week 3, 43 miles week 4</td>
</tr>
<tr>
<td>b. $x = \text{number of miles ran in first week}$</td>
<td></td>
</tr>
<tr>
<td>$x = 20$</td>
<td>d.</td>
</tr>
</tbody>
</table>

6. Cassie and Tom wanted hamburgers for lunch. Cassie ordered a hamburger for $4 and an order of fries. Tom ordered twice Cassie’s order. The total price was $16.65 (before tax). What is the cost of one order of fries?

<table>
<thead>
<tr>
<th>Expression</th>
<th>Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>a. $(4 + x) + 2(4 + x) = 16.65$</td>
<td>c. An order of fries costs $1.55</td>
</tr>
<tr>
<td>b. $x = \text{cost of one order of fries}$</td>
<td></td>
</tr>
<tr>
<td>$x = 1.55$</td>
<td>d.</td>
</tr>
</tbody>
</table>

7. Lupe and Carlos work in an office. Carlos makes $16,000 less than twice Lupe’s salary. The sum of their two salaries is $104,000. How much are their salaries?

<table>
<thead>
<tr>
<th>Expression</th>
<th>Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>a. $(2x – 16,000) + x = 104,000$</td>
<td>c. Lupe’s salary is $40,000, Carlos’s salary is $64,000</td>
</tr>
<tr>
<td>b. $x = \text{Lupe’s salary}$</td>
<td>d.</td>
</tr>
<tr>
<td>$x = 40,000$</td>
<td></td>
</tr>
</tbody>
</table>
8. The neighborhood candy store sold 336 candy items this week. Twice as many M&Ms were sold as Snickers, and three times as many Crunch bars were sold as Snickers bars. How many of each kind of candy were sold this week?

a. $336 = x + 2x + 3x$

b. $x =$ number of Snickers sold
$x = 56$

c. 56 Snickers, 112 M&Ms, and 168 Crunch bars were sold.

d.

9. Paul and Ringo went to the music store. Paul bought some guitar picks for $6 and a package of guitar string. Ringo bought some new drumsticks for $8. Then Paul remembered he had a coupon for $5 off. The final bill after the coupon was $15. How much was the package of guitar string?

a. $6 + x + 8 - 5 = 15$

b. $x =$ price of package of guitar string
$x = 6$

c. The package of guitar string cost $6

d.

10. Steve, Tyrel, and Josh spent a total of $20 at the soccer game. It costs $3 for each one of them to get into the game. Each boy also bought a program. Josh bought a foam hand to wave in the bleachers. The foam hand was $5. What is the cost of one program?

a. $20 = 3(3) + 3x + 5$

b. $x =$ cost of one program
$x = 2$

c. One program costs $2

d.

11. A total of 960 students attend Bosco Middle School. Some students walk to school, some ride the bus, and the rest come by car. The ratio of bus-riders to walkers to car riders is 6:3:1. How many students come to school by each form of transportation?

a. $960 = 6x + 3x + x$

b. $x =$ number of students arriving by car
$x = 96$

*What percent of students are bus-riders? $576/960 = .6m$ thus 60%*

c. 96 students arrive by car, 576 students arrive by bus, 288 students walk.

d.
12. Mr. Manycattle drove to Mexican Hat, Utah from southern New Mexico in 4 days. On Monday and Wednesday, he traveled exactly the same distance. On Tuesday, he traveled 2 times as far as he did on Monday, and on Thursday, he traveled 3 times as far as he did on Monday. If the total trip covered 602 miles, how far did Mr. Manycattle travel each day of his trip? Which fraction describes the part of the trip covered on each day?

| a. 602 = x + 2x + x + 3x | c. On Monday he travelled 86 miles, 1/7
| b. x = distance travelled on Monday and Wednesday | Tuesday he travelled 172 miles, 2/7
| x = 86 | Wednesday he travelled 86 miles, 1/7
| *approximately 14.3% of the trip happened on Monday & Wednesday, 28.6% on Tuesday, and 42.9% on Thursday. | Thursday he travelled 258 miles, 3/7

d. 

13. Ana had $60 to spend at the mall. She bought 2 shirts for $12.99 each, and 3 pounds of candy for $2.89 per pound. How much money does she have left?

| a. 60 = 2(12.99) + 3(2.89) + x | c. Ana has $25.35 left |
| b. x = amount of money left | |
| x = 25.35 | |

d. |
6.2d Homework: Write and Solve Equations from Word Problems III

For each context: a) write an equation, b) solve your equation, c) answer the question in a complete sentence, and d) check your answer. You may need to do your work on a separate sheet of paper.

1. Allie had $24. After buying seven art pencils and a $0.35 eraser, she had $10 left. How much did each pencil cost?

2. Sarah won 40 super bouncy balls playing horseshoes at her school's game night. Later, she gave two each to some of her friends. If she has 8 remaining bouncy balls, to how many friends did she give bouncy balls?

3. At the local clothing store all shirts were on sale for one price and sweaters for a different price. Lonnie purchased three sweaters and two shirts for $130. If the sale price of a shirt was five dollars less than the sale price of a sweater, how much did each item cost Lonnie?

4. Brock ate 16 Girl Scout cookies in 5 days (he wasn’t suppose to eat any cookies because they belonged to his sister.) The second day he ate 3 more than the first (he felt pretty bad about that.) The third day he ate half as much as the 1st day (he was able to get better control of himself.) The fourth and fifth days, he ate twice each day what he ate the first day (he really likes Girl Scout cookies.) How many cookies did he eat each day?

\[ 16 = x + (x + 3) + 1/2x + 2x + 2x \]

\[ x = 2 \]

The first day he ate 2 cookies, the second day he ate 5 cookies, the third day he ate 1 cookie, the fourth and fifth days he ate 4 cookies.
5. Cassie and Tom went to the hamburger stand. Cassie ordered a hamburger for $4 and an order of fries. Tom was really hungry, so he doubled Cassie’s ordered for himself. The total price was $18 (before tax). What’s the cost of one order of fries?

6. A collection of marbles has been divided into 3 different sets. The middle sized set is 2 times the size of the smallest set, and the largest set is 3 times as large as the middle-sized set. What fraction describes each part of the total marble collection?

\[ x + 2x + 3(2x) = 1 \]

\[ x = \frac{1}{9}, \text{ the smallest is } \frac{1}{9}, \text{ the middle is } \frac{2}{9}, \text{ the largest is } \frac{6}{9} \]

7. Challenge: Brian buys 1 pack of baseball cards to add to the 2 cards a friend gave him. Then his mother gives him 2 more packs as a special treat. Now he has as many cards as Marcus who owns 1 pack plus 12 loose cards. How many cards are in each pack?
1. Zach invested $1500. If he earned 23.2% on his investment, a) write a proportion to find the amount of money he earned and b) state how much money he now has.

   a) \( \frac{x}{1500} = \frac{23.2}{100} \)  
   b) $1848

2. Use the number line below to show why (-1)(-1) = 1

   ![Number Line]

3. If the ratio of girls to boys in a class is 3 to 4 and there are 35 students in the class. How many students are girls? There are 15 girls in the class (and 20 boys.)

4. Lin is drawing a scale model of his school. He uses a scale of 1 in = 5 feet. If his classroom is 30 feet by 25 feet, what will be the dimension of the classroom on his scale model?

5. The equation \( p = 6h \) shows how many pies Pi Tree Bakery sells on a given day. What is the unit rate? 6 pies per hour
### 6.2e Extra Practice: Write and Solve Equations

<td>I can solve multi-step real-life problems involving calculations with integers with an equation without a model.</td>
<td>I can solve multi-step real-life problems involving calculations with rational numbers.</td>
</tr>
<tr>
<td>4. Determine the reasonableness of an answer to a contextual problem.</td>
<td>I struggle to determine the reasonableness of an answer to a contextual problem.</td>
<td>I can determine if the answer to a contextual problem is reasonable, but I struggle to explain why.</td>
<td>I can determine if the answer to a contextual problem is reasonable, and I can to explain why.</td>
<td>I can determine if the answer to a contextual problem is reasonable, and I can to explain why. If it is not reasonable, I can rethink that problem to find a reasonable answer.</td>
</tr>
</tbody>
</table>
Sample Problems for Section 6.2

1. Write an equation for each context. Draw a model first if necessary.
   a. Tom has $12,484 in his bank account. Six months ago, he had $1,240. How much does Tom get paid each month if he has only deposited his monthly paycheck into his account?

   b. Sixty-five pounds of candy was divided into four different boxes. The second box contained twice the amount of the first box. The third box contained two more pounds than the first box. The last box contained one-fourth the amount in the second box. How much candy was in each box?

   c. Simon is ordering equipment for his tennis team. He orders a racquet and can of three tennis balls for each player. Each can of balls costs $4. For a team of 5 players, his bill total is $415. How much does each racquet cost?

2. Write a context that models the following equations. At least one context should be real-life.

   \[ 2L + 2(3L) = 990 \]
   \[ 3m + 4(m - 0.50) = 12 \]
   \[ 46 = 6x + 2 \]
3. Solve the following real-life problems.
   a. The sum of two numbers is 52. One number is three less than quadruple the other number. What are the two numbers?

   b. Martha divides $94 amongst her four friends. Leon gets twice as much money as Kokyangwuti. Jill gets five more dollars than Leon. Isaac gets ten less dollars than Kokyangwuti. How much money does each friend get?

   c. Elizabeth has $26 left after shopping at the mall. She bought 2 shirts for $22.99 each, a drink for $2.02, and 2 books for $16 each. How much money did she start with?

4. For each of the contexts in problem 3, answer the following questions:
   a. Is the answer reasonable or not?
   b. Why is or isn’t it reasonable?
   c. If it isn’t reasonable, explain what is wrong with the answer and rethink the problem.
6.3 Solve and Graph Inequalities, Interpret Inequality Solutions

Section Overview: Students begin this section by reviewing from 6th grade how to write inequalities and graph them on a number line. They then move to solving and graphing one-step and multi-step inequalities using their knowledge of solving one-step and multi-step equations. The section ends with students writing and solving one- and multi-step contextual inequality problems.

Throughout this section it is important that students understand the similarities and differences between finding the solution to an equation and finding solution(s) to an inequality. Students should also understand the relationship of each to the real line.

Language is particularly difficult for some students in this section. Phrases like “less than” or “greater than” in the previous section indicated an operation (e.g. subtract or add), in this section they may indicate < or >. Help students to look at contexts holistically. Making sense of problem situations is critical with writing equations and/or expressions. Also help students predict the type of answers they will be getting as a way of interpreting how to write the context in algebraic form.

Students will also be reviewing number sense with integers in this section.

Concepts and Skills to be Mastered (from standards)

By the end of this section, students will be able to:
1. Use variables to create inequalities that model word problems.
2. Solve word problems leading to linear inequalities.
3. Use symbols of inequality to express situations in which solutions are greater than or less than a given value.
6.3a Class Activity and Homework: *Review of Inequality Statements*.
Review from 6th grade: writing and graphing inequalities.

Write inequalities for each statement below. For statements 1 – 4, the variable is identified for you. For statements 5 – 15, you must write what the variable will represent.

<table>
<thead>
<tr>
<th>Example: The Garcia family car seats seven (with seat-belts) at most. “x” is the number of people that can sit in the Garcia’s car.</th>
<th>x  7</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. A school bus can seat at most 48 students. “x” is the number of people that can ride the bus.</td>
<td>x ≤ 48</td>
</tr>
<tr>
<td>2. In many states you must be at least 16 years old to obtain a driver’s license. “x” is the age you must be to obtain a driver’s license.</td>
<td>x &gt; 16</td>
</tr>
<tr>
<td>3. It isn’t safe to use a light bulb of more than 100 watts in many light fixtures. “x” is how many watts a light fixture has.</td>
<td>x ≤ 100</td>
</tr>
<tr>
<td>4. At least 250 parents attended back-to-school night. “x” is the number of parents that attended back-to-school night.</td>
<td>x ≥ 250</td>
</tr>
<tr>
<td>5. You must be no more than 15 years old to attend the middle school dance. “x” is the age of people who can attend the dance.</td>
<td>15 ≥ x  \ x ≤ 15</td>
</tr>
<tr>
<td>6. A plane must travel at least 120 miles per hour to stay in the air. So as not to break the sound barrier, a plane must travel under 760 miles per hour. “x” is the speed of a place that stays in the air and doesn’t break the sound barrier.</td>
<td>120 ≤ x  \ &lt; 760</td>
</tr>
<tr>
<td>7. Children must by at least 48 inches tall to ride the roller coaster. “x” is the height of children tall enough to ride the rollercoaster.</td>
<td>x ≥ 48</td>
</tr>
<tr>
<td>8. You must have less than 3 tardies to get a satisfactory citizenship grade. “x” is the number of tardies to get a satisfactory citizenship grade.</td>
<td>3 &gt; x   \ x &lt; 3</td>
</tr>
<tr>
<td>9. Children younger than age 5 can get in free. “x” is the age of children that get in free.</td>
<td>5 &gt; x   \ x &lt; 5</td>
</tr>
<tr>
<td>10. To hunt big game in Utah a hunter must be at least 12 years old. “x” is the age to be able to hunt big game.</td>
<td>x ≥ 12</td>
</tr>
<tr>
<td>11. The elevator can hold a maximum of 20 people. “x” is the number of people the elevator can hold.</td>
<td>x ≤ 20</td>
</tr>
<tr>
<td>12. To work the track at the community gym, you must be at least 16 years old. “x” is the age to use the track.</td>
<td>x ≥ 16</td>
</tr>
<tr>
<td>13. To join the FBI, you must be at least 23, but younger than 37 years old. “x” is the age to join the FBI.</td>
<td>23 ≤ x  \ &lt; 37</td>
</tr>
</tbody>
</table>
14. To run the class they must have no less than 12 participants registered. “x” is the number of participants to run the class. 

| 12 ≤ x | x ≥ 12 |

15. On the seven day family vacation, the Jones family traveled 12 miles on the shortest driving day and 500 miles on the longest driving day. “x” is the distance travelled on any of the 7 days.

| 12 ≤ x | ≤ 500 |

Write situations to go with the following inequalities. Make up the situation and inequality for the last one.

| 16. ANSWERS WILL VARY: All of my siblings are under the age of 7. | x < 7 |
| 17. ANSWERS WILL VARY: My sisters and I are all at least 13 years old | x ≥ 13 |
| 18. ANSWERS WILL VARY: The amount of money I owe my mom is 6 dollars or less. | x ≤ -6 |

Review: graphing inequalities on a number line:

Examine the inequality graphs below. Discuss the questions below as a class.

How are the inequalities shown on the number line? Help students see that a portion of the line is indicated rather than just one point.

Ask students: Why is the boundary number shown by an open circle on one and a closed circle on the other? Open circle means:

Closed circle means:

Next to each number line above, write the inequality represented by the number line above.
Practice Graphing Inequalities on a number line.

</tbody>
</table>
6.3b Class Activity: Solve and Graph Inequalities

Activity 1: Every hour 92 people enter an office building and 30 people exit. If the building starts empty, after how many hours will there be more than 350 people in the building.

a) Draw a model to illustrate what’s happening in this context.

b) In this context, what does “more than”?

c) Write an inequality for the situation.

\[350 < 92x - 30x\] or \[92x - 30x > 350\] Students may have trouble determining the direction of the inequality. Asking students, “which side do you want bigger?” may help them.

d) If you double the people entering and exiting, how will it affect your time? For \[350 < 92x - 30x\] \(x > 350/62\) or 5.645. For \[350 < 184x - 60x\], \(x > 350/124\) or \(x > 2.822\), i.e. it cuts the time in half.

Activity 2: A 150-pound person burns 6 calories per minute when walking at a speed of 3.5 miles per hour. While walking, this person eats a snack that has 40 calories. This snack subtracts from the calories burned while walking.

a. How long must the person walk at this speed to burn at least 190 calories?

\[190 \leq 6x - 40, \quad 38 \frac{1}{3} \leq x\]; The person must walk at least \(38 \frac{1}{3}\) minutes

b. Explain what will happen if the person walks for a longer period of time? Shorter period of time?
For a longer period of time, the person will burn more calories. For a shorter period of time the person will burn less calories

c. Write and graph an inequality that describes the solution to this situation.

\[38 \frac{1}{3} \leq x \] or \(x \geq 38 \frac{1}{3}\)

d. Extension: What if the person wanted to spend less time exercising but burn the same number of calories. How is this possible? Possible answers: walk faster, don’t eat snacks

Activity 3: Explore Inequality Statement: Consider the following two inequality statements

\(x \leq 2\) and \(2 \leq x\)

In your own words, describe the solution set for each and then draw a graph of the solution set.

\(x \leq 2\), the solution set is 2 and every number less than 2. Students might also say, every number less than or equal to 2.

\(2 \leq x\), the solution set is 2 and every number greater than 2. Students might also say, every number greater than or equal to 2.

Discuss how to rewrite \(2 \leq x\) so that \(x\) is first. Also point out that the convention is to write the variable first.
Activity 4: Exploring Inequality Statements:

a. What is the solution set for \( x > 6 \). In other words, what value(s) of “x” make this statement true? Write both an inequality statement and graph your solution on a number line.
\[ x > 7 \]

b. What is the solution set for \( 2x < 6 \). In other words, what value(s) of “x” make this statement true? Write both an inequality statement and graph your solution on a number line. \( x < 3 \)

c. What is the solution set for \( 3x - 7 \geq 13 \). In other words, what value(s) of “x” make this statement true? Write both an inequality statement and graph your solution on a number line.
\[ x \geq \frac{20}{3} \]

d. Describe what you did to find the solution set. Students will likely notice that solving an inequality is much like solving an equality. In 6.3c they will learn why, when multiplying or dividing by a negative, the direction of the inequality reverses. None of the exercise below require reversing the inequality.

Find the solution set for each inequality. Then graph the solution set. Scale the number lines appropriately.

Company E: [Table]
Company F: [Table]
6.3c Class Activity: Multiplying by a negative when Solving Inequalities

Consider the inequality $4 > 1$.

- Question: If you multiply both sides of an inequality by the same positive number do you expect the inequality to remain true? Why or why not?
  
  You are working to develop a solid understanding of why multiplying by a negative “reverses” the inequality sign.

- Question: If you multiply both sides of an inequality by the same negative number do you expect the inequality to remain true? Why or why not?

1. Test your answers from above. Complete the table by filling in the middle column with $<, >,$ or $=.$

<table>
<thead>
<tr>
<th>4</th>
<th>$&gt;$</th>
<th>1</th>
<th>True or untrue?</th>
<th>If untrue, what must be done for the inequality to be true?</th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
<td>$&gt;$</td>
<td>1</td>
<td>true</td>
<td></td>
</tr>
<tr>
<td>4</td>
<td>$&gt;$</td>
<td>1</td>
<td>true</td>
<td></td>
</tr>
<tr>
<td>4</td>
<td>$&gt;$</td>
<td>1</td>
<td>true</td>
<td></td>
</tr>
<tr>
<td>4</td>
<td>$&gt;$</td>
<td>1</td>
<td>true</td>
<td></td>
</tr>
<tr>
<td>4</td>
<td>$&gt;$</td>
<td>1</td>
<td>untrue</td>
<td>replace $&gt;$ with $=$</td>
</tr>
<tr>
<td>4</td>
<td>$&gt;$</td>
<td>1</td>
<td>untrue</td>
<td>inequality should be opposite</td>
</tr>
<tr>
<td>4</td>
<td>$&gt;$</td>
<td>1</td>
<td>untrue</td>
<td>inequality should be opposite</td>
</tr>
<tr>
<td>4 0</td>
<td>$&gt;$</td>
<td>1</td>
<td>untrue</td>
<td></td>
</tr>
</tbody>
</table>

2. Under what conditions did the inequality become untrue? Why does that condition make the inequality untrue? Multiplying by a negative number or 0 makes the inequality untrue.

3. Solve the inequality $\frac{x}{2} < 2$, explain your procedure. Write and graph the solution.

   $x > -4$, multiply both sides by $-2$ and switch the inequality

4. Check your solution for varying values for x. Is your graph correct?

<table>
<thead>
<tr>
<th>In the inequality $\frac{x}{2} &lt; 2$, if the value for $x$ is…</th>
<th>-8</th>
<th>-6</th>
<th>-3</th>
<th>-2</th>
<th>0</th>
<th>2</th>
<th>4</th>
<th>6</th>
<th>8</th>
</tr>
</thead>
<tbody>
<tr>
<td>Write the inequality.</td>
<td>$\frac{4}{2}$</td>
<td>$\frac{3}{2}$</td>
<td>$\frac{3}{2}$</td>
<td>$0$</td>
<td>$0$</td>
<td>$-1$</td>
<td>$-2$</td>
<td>$-3$</td>
<td>$-4$</td>
</tr>
<tr>
<td>…is you solution set true?</td>
<td>F</td>
<td>F</td>
<td>T</td>
<td>T</td>
<td>T</td>
<td>T</td>
<td>T</td>
<td>T</td>
<td>T</td>
</tr>
</tbody>
</table>
5. Solve and graph the solution to \( \frac{x}{3} \leq 27 \).

\( x \leq 27 \)

Check your values in your solution set to make sure your answer is correct.

6. What about dividing by a negative number? What do you expect? Solve and graph the inequality \( 2x > 6 \), explain your procedure.

\( x < -3 \), divide both sides by \(-2\), switch the inequality

7. Test your solution.

<table>
<thead>
<tr>
<th>In the inequality ( 2x &gt; 6 ), if the value for ( x ) is…</th>
<th>-8</th>
<th>-6</th>
<th>-3</th>
<th>-2</th>
<th>-1</th>
<th>0</th>
<th>2</th>
<th>4</th>
<th>6</th>
</tr>
</thead>
<tbody>
<tr>
<td>Write the inequality.</td>
<td>16 &gt; 6</td>
<td>12 &gt; 6</td>
<td>6 &gt; 6</td>
<td>4 &gt; 6</td>
<td>-2 &gt; 6</td>
<td>-4 &gt; 6</td>
<td>-8 &gt; 6</td>
<td>-12 &gt; 6</td>
<td></td>
</tr>
<tr>
<td>…is you solution set true?</td>
<td>T</td>
<td>T</td>
<td>F</td>
<td>F</td>
<td>F</td>
<td>F</td>
<td>F</td>
<td>F</td>
<td>F</td>
</tr>
</tbody>
</table>

8. Finish this sentence: When you multiply or divide both sides of an inequality by the same negative number… the inequality changes.

Solve the following problems by first writing an inequality and then solving the inequality.

9. Kyle and Mika aren’t very good at the trivia game. In the game a wrong answer gives your team a negative two-thirds of a point. If at the end of the game, Kyle and Mika have never scored more than a negative 8 points, how many wrong answers do they usually give?

Inequality: \( -\frac{2}{3}x \leq -8 \) (the less than or equal to symbol shows that their score is always lower than or at -8.)

Solution: \( x \geq 12 \); They give at least 12 wrong answers.

10. You have $10 to spend at the school carnival. If each game costs $0.25, how many games can you play?

Inequality: \( 10 - 0.25x \geq 0 \) This shows that we’re starting with $10 and we are subtracting $0.25 for each game.

Solution: \( x \leq 40 \); This means we can only play up to and including 40 games. NOTE, we cannot play less than 0 games either. So the solution set is really \( 0 \leq x \leq 40 \)
Practice solving inequalities involving multiplication or division by negative numbers.

11. \(5t \leq 25\)  
   \(t \leq 125\)

12. \(\frac{2y}{3} < 4\)  
   \(y > 6\)

13. \(\frac{1}{2}p > 4\)  
   \(p < 2\)

14. \(\frac{y}{4} \geq 5\)  
   \(y \geq 20\)

15. \(\frac{5}{2n} \geq 3\)  
   \(n \geq 1\)

16. \(\frac{x}{2} \geq 18\)  
   \(x \geq 36\)

17. \(2(x+4) \geq 28\)  
   \(x \geq -18\)
### 6.3c Homework: Multiplying by a negative when Solving Inequalities

Solve the following inequalities. Graph your solution on the number line.

<p>| | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>

<tr>
<td>6.</td>
<td>(7.5 - 2n &gt; 2)</td>
<td><img src="image6" alt="Graph" /></td>
</tr>
<tr>
<td>7.</td>
<td>(3(x - 4) \leq 24)</td>
<td><img src="image7" alt="Graph" /></td>
</tr>
<tr>
<td>8.</td>
<td>(\frac{3}{4}n - 21 &gt; 15)</td>
<td><img src="image8" alt="Graph" /></td>
</tr>
<tr>
<td>9.</td>
<td>(6.5 + 2n &gt; 5)</td>
<td></td>
</tr>
<tr>
<td>-----</td>
<td>------------------</td>
<td></td>
</tr>
<tr>
<td>10.</td>
<td>(2x - \frac{2}{3} &gt; \frac{16}{3})</td>
<td></td>
</tr>
<tr>
<td>11.</td>
<td>(0.75 &gt; -\frac{2x}{4})</td>
<td></td>
</tr>
<tr>
<td>12.</td>
<td>(\frac{x}{7} - \frac{2}{3} &gt; \frac{13}{3})</td>
<td></td>
</tr>
</tbody>
</table>

**Spiral Review**

1. Solve for \(a\). \(a + \frac{3}{4} = 5\) \(a = 4\frac{1}{4}\)

2. Factor the following expressions.
   - \(3x - 6\)
   - \(3(x - 2)\)
   - \(15 - 20y\)
   - \(5(3 - 4y)\)
   - \(\frac{5}{3}x + \frac{2}{3}\)
   - \(\frac{1}{3}(5x + 2)\)
   - \(4.9t - 2.8\)
   - \(0.7(7t - 4)\)

3. Bubba can make \(7\frac{1}{2}\) sandwiches in \(\frac{1}{2}\) hour. Find the following unit rates.
   a. ___15___ sandwiches per hour
   b. ___\frac{1}{3}___ hours per sandwich
   c. ___\frac{4}{3}___ minutes per sandwich

4. Solve: \(2x + 1 < -3\)

5. Chloe has twice as many cats as her sister has dogs. Her brother has 3 turtles. Together, they have six pets. How many of each pet do they have?
   - Cats = 2, Dogs = 1, Turtles = 3
6.3d Class Activity: Write and Solve Inequalities for Word Problems

Follow the structure below to solve and graph each inequality. The first problem has been started for you as an example. Answers below show variables on the left, students may write them with variables on the right.

1. Andy has $550 in a savings account at the beginning of the summer. He wants to have at least $200 in the account by the end of the summer. He withdraws $25 each week for food, clothes, and movie tickets. How many weeks will his money last?

<table>
<thead>
<tr>
<th>Known Information</th>
<th>Variable and what it represents</th>
<th>What’s the relationship?</th>
<th>Inequality</th>
</tr>
</thead>
<tbody>
<tr>
<td>Starts with $550</td>
<td>$w = \text{number of weeks money can last}$</td>
<td>The money Andy has needs to be more (bigger) than or equal to $200</td>
<td>$550 - 25w \geq 200$</td>
</tr>
</tbody>
</table>

Solution and what it means

$w \leq 14$ his money will last at most 14 weeks.

2. On vacation, Katelyn wanted to have her hair braided in multiple braids to cover her head. The beautician charges a flat rate of $4, plus $0.75 per braid. She’s saved $29 to get braids. How many braids can she get?

<table>
<thead>
<tr>
<th>Known Information</th>
<th>Variable and what it represents</th>
<th>What’s the relationship?</th>
<th>Inequality</th>
</tr>
</thead>
<tbody>
<tr>
<td>costs flat rate of $4</td>
<td>$b = \text{number of braids she can get}$</td>
<td>The cost must be smaller than 29</td>
<td>$4 + 0.75b \leq 29$</td>
</tr>
</tbody>
</table>

Solution and what it means

$b \leq 33 \frac{1}{3}$, she can get at most 33 braids.

3. Maria is starting a small DVD business online. She makes $2.25 on each DVD she sells. To start her business though, she had to invest $750. How many DVDs does she need to sell before he starts to make a profit?

<table>
<thead>
<tr>
<th>Known Information</th>
<th>Variable and what it represents</th>
<th>What’s the relationship?</th>
<th>Inequality</th>
</tr>
</thead>
<tbody>
<tr>
<td>Each DVD is a profit of $2.25</td>
<td>$d = \text{number of orders DVD Maria gets}$</td>
<td>The money she makes has to be more than $750</td>
<td>$2.25d \geq 750$</td>
</tr>
</tbody>
</table>

Solution and what it means

$d \geq 333.33$, this means she will need to sell 334 DVDs to make a profit. 333 is not quite enough.
4. The Community Swimming Pool charges a flat rate of $50 for a birthday party plus $2.50 for each person. Deborah can’t spend more than $100. How many friends can she invite?

<table>
<thead>
<tr>
<th>Known Information</th>
<th>Variable and what it represents</th>
<th>What’s the relationship?</th>
<th>Inequality</th>
</tr>
</thead>
<tbody>
<tr>
<td>• flat rate of $50</td>
<td>f= number of friends she can invite</td>
<td>The cost must be smaller than 100</td>
<td>$50 + 2.50f \leq 100</td>
</tr>
</tbody>
</table>

Solution and what it means

\[ f \leq 20 \], she can invite 20 friends.

5. David owns a Yellow Cab. The company charges a flat rate of $2.50 for every cab ride, plus $0.85 per mile. David figures he needs to average at least $12 for each cab ride to make a profit. At least how many miles must rides average to make a profit?

<table>
<thead>
<tr>
<th>Known Information</th>
<th>Variable and what it represents</th>
<th>Inequality Sign</th>
<th>Inequality</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Flat rate of $2.50</td>
<td>m= number of miles he can go</td>
<td>The money he makes needs to be more than 12</td>
<td>$2.50 + 0.85m \geq 12</td>
</tr>
</tbody>
</table>

Solution and what it means

\[ m \geq 11.18 \], rides need to average at least 11.18 miles.
6. Jacques has a pre-paid phone plan. He has $45 to spend and each minute costs $0.39, what is the most minutes he can buy?

<table>
<thead>
<tr>
<th>Known Information</th>
<th>Variable and what it represents</th>
<th>Inequality Sign</th>
<th>Inequality</th>
</tr>
</thead>
</table>
| • Each minute costs $0.39  
• Has $45 | m = number of minutes he can buy | the amount he spends needs to be smaller than $45 | $0.39m \leq 45 |

Solution and what it means

\( m \leq 115.385 \), he can buy 115 minutes.

7. Harry wants to download some songs to his mp3 player. If he gets a $20 gift card for his birthday and each song costs $0.90, at most how many songs can he download?

<table>
<thead>
<tr>
<th>Known Information</th>
<th>Variable and what it represents</th>
<th>Inequality Sign</th>
<th>Inequality</th>
</tr>
</thead>
</table>
| • Each song costs $0.90  
• Has a $20 gift card | s = number of songs he can buy | \( \leq \) | \( 0.90s \leq 20 \) |

Solution and what it means

\( s \leq 22.22 \), he can download 22 songs.
### 6.3d Homework: Write and Solve Inequalities for Word Problems

Write and solve inequalities for each word problem below. Use the structure from Class Activity 6.3d as a frame for solving each.

1. Kimberly took her 6 nieces and nephews to a hockey game. She wants to buy them snacks. How much can she spend on snacks for each child if Kimberly wants to spend less than $33 in total?
   
   \[68 \frac{1}{3} \leq m\]

2. The school is having a fundraiser. They are running a carnival. Tickets sell for $0.50 each. They are planning on buying supplies for the carnival that cost $50. How many tickets must they sell to raise at least $200?

3. Billy needs to read 500 minutes this week for his English class. He is going to read 6 days. If he already reads 15 minutes every day, how many additional minutes does he need each day to read at least 500 minutes?
   
   \[m \leq 256.80\]

4. Erin is buying cupcakes for her birthday party. Each cupcake costs $1.50. How many guests can she invite if her budget is $80 and she has already spent $16 on paper cups and plates? By the way, Erin thinks that each guest will want two cupcakes to eat.

5. Lauren got $321 from various relatives on her birthday. If she wants to put 20% of the money into her savings account, how much will she have left over to spend on new clothes?

6. Peter is trying to set a new record for pizza deliveries. His previous record is 20 pizzas in one hour. He has already delivered 2 pizzas in 5 minutes. How many pizzas will he need to average per minute to beat his previous record?
7. Mrs. Brown is ordering pictures of her new baby. There is a $20 sitting fee and each 5x7 portrait she orders is $4. She also has a coupon for $10 off. If she wants to spend less than $50, how many 5x7 portraits can she order?

8. Stuart’s Painting Service charges a $50 supplies fee plus $10 per hour painting. Andrew’s Awesome Painting charges a $20 supplies fee plus $20 per hour painting. For how many hours does Andrew charge less than Stuart? $3 > h$

9. The technology department is having a fundraiser. They want to make at least $1000 by selling hoodies for $25. Each hoodie costs them $15. How many will they need to sell to reach their goal?

<table>
<thead>
<tr>

9. \(28 \leq 9 + 7y + 5\)  

10. \(23 \geq 4(y - 0.25)\)  

\[y \geq 6\]

11. Van has an old cell phone he has to buy minutes for. He has $55 to spend and each minute costs $0.49, what is the most minutes he can buy?

12. The Yellow Cab Taxi charges a flat rate of $3.50 for every cab ride, plus $0.95 per mile. Tofi needs a ride from the airport. He only has $30 cash. How many miles can he go?

13. Vicki wants to play a video game that charges you $0.12 per minute. If she has $15 to spend, how many minutes can she play at most?

\[m \leq 125, \text{ she can play at most } 125 \text{ minutes.}\]
Spiral Review

1. A spinner contains three letters of the alphabet.
   a. How many outcomes are possible if the spinner is spun three times?
      \[ 3 \cdot 3 \cdot 3 = 27 \]
   b. List all of the outcomes for spinning three times. AAA, AAB, AAC, ABA, ABB, ABC, ACC, ACB, ACA, BBB, BBA, BBC, BAA, BAB, BAC, BCB, BCA, BCC, CCC, CCA, CCB, CBA, CBB, CBC, CAC
   c. What is the probability of getting exactly one A in three spins?
      \[ \frac{12}{27} = \frac{4}{9} = 0.4 = 44.4\% \]

2. Express each percent as a fraction in simplest form.
   - 35\% \quad \frac{35}{100} = \frac{7}{20}
   - 22\% \quad \frac{22}{100} = \frac{11}{50}

3. Simplify the following expression. Use a model if needed.
   \[ 71b - 4a + 4b - 4a \]

4. What is 30\% of 150? Use a bar model.
   \[ \frac{45}{15} \]  

5. Will the following side lengths make a triangle? Why or why not?
   a. 5 cm, 4 cm, 18 cm
   b. 3 ft, 3 ft, 2 ft
   c. 3 in, 6 in, 3 in
6.3f Self-Assessment: Section 6.3

Sample Problems for Section 6.3

1. Solve each of the following equations with or without a model.

a. 
\[
\begin{align*}
1 < x + 7 & \quad 2x + 3 > 7 & \quad 30 \quad \frac{x}{7} & \quad 20 \\
\end{align*}
\]

b. 
\[
\begin{align*}
3(x - 6) & \quad 9 & \quad \frac{2x + 4}{2} & \quad 3x + 5x + 4 > 4 \\
\end{align*}
\]

c. 
\[
\begin{align*}
2(x - 9) & \quad 7 & \quad \frac{6x + 6}{6} & \quad 2x + 8x + 4 > 8 \\
\end{align*}
\]

d. 
\[
\begin{align*}
0.8x + (8) & \quad < 0 & \quad \frac{1}{2} \quad (2x + 7) > \frac{3}{4} & \quad \frac{1}{4} \quad 2.4x + 10 & \quad 3.5x \\
\end{align*}
\]
2. Write an inequality for each context. Draw a model first if necessary.
   a. A moving company is shipping my stuff on a move from Sandy to St George. The maximum weight on Utah roads for a truck is 80,000 lbs. If the empty truck and trailer weigh 32,500 lbs and other people have stuff on the truck already weighing 35,000 lbs total, how much can my stuff weigh?
   
   b. In Whatsitville, speeding tickets are fined $75 plus $13 for every mile over the speed limit. If Mr. Bo is pulled over and told his ticket will be at least $400. At least how much over the speed limit was he?
   
   c. Jenna’s credit card requires that she pay at least 10% of her balance each month. If she pays at least $44, what is the most her balance could be?

3. Write an inequality to represent each of the following word problems. Solve each problem. Explain your solution in context.
   a. Loralie is having a birthday. She wants to bring treats for her friends at school. Her mom gives her $20. How much can she spend per friend if she wants to bring treats for herself and eight friends?
   
   b. Jeremy is two years older than Rachel. The sum of the ages of Jeremy and Rachel is less than 46. How old could Jeremy be?
   
   c. Kathryn is five years old and so excited to ride all the rides at the local amusement park. Unfortunately, she is 42.5 in tall and one ride requires that she be at least 50 in. You want to tell her in about how many years, she’ll be able to ride. A quick google search shows that the average child grows $2 \frac{1}{2}$ in per year. How many years will you tell Kathryn it will be until she can ride all the rides?

4. For each of the contexts in problem 3, answer the following questions:
   a. Is the answer reasonable or not?
   b. Why is or isn’t it reasonable?
   c. If it isn’t reasonable, explain what is wrong with the answer and rethink the problem.

Chapter 7: Probability and Statistics (3 weeks)

UTAH CORE Standards
Probability and Statistics:

Use random sampling to draw inferences about a population.
1. Understand that statistics can be used to gain information about a population by examining a sample of the population; generalizations about a population from a sample are valid only if the sample is representative of that population. Understand that random sampling tends to produce representative samples and support valid inferences. 7.SP.1
2. Use data from a random sample to draw inferences about a population with an unknown characteristic of interest. Generate multiple samples (or simulated samples) of the same size to gauge the variation in estimates or predictions. For example, estimate the mean word length in a book by randomly sampling words from the book; predict the winner of a school election based on randomly sampled survey data. Gauge how far off the estimate or prediction might be. 7.SP.2

Draw informal comparative inferences about two populations.
3. Informally assess the degree of visual overlap of two numerical data distributions with similar variabilities, measuring the difference between the centers by expressing it as a multiple of a measure of variability. For example, the mean height of players on the basketball team is 10 cm greater than the mean height of players on the soccer team, about twice the variability (mean absolute deviation) on either team; on a dot plot, the separation between the two distributions of heights is noticeable. 7.SP.3
4. Use measures of center and measures of variability for numerical data from random samples to draw informal comparative inferences about two populations. For example, decide whether the words in a chapter of a seventh-grade science book are generally longer than the words in a chapter of a fourth-grade science book. 7.SP.4

Investigate chance processes and develop, use, and evaluate probability models.
5. Understand that the probability of a chance event is a number between 0 and 1 that expresses the likelihood of the event occurring. Larger numbers indicate greater likelihood. A probability near 0 indicates an unlikely event, a probability around 1/2 indicates an event that is neither unlikely nor likely, and a probability near 1 indicates a likely event. 7.SP.5
6. Approximate the probability of a chance event by collecting data on the chance process that produces it and observing its long-run relative frequency, and predict the approximate relative frequency given the probability. For example, when rolling a number cube 600 times, predict that a 3 or 6 would be rolled roughly 200 times, but probably not exactly 200 times. 7.SP.6
7. Develop a probability model and use it to find probabilities of events. Compare probabilities from a model to observed frequencies; if the agreement is not good, explain possible sources of the discrepancy. 7.SP.7
   a. Develop a uniform probability model by assigning equal probability to all outcomes, and use the model to determine probabilities of events. For example, if a student is selected at random from a class, find the probability that Jane will be selected and the probability that a girl will be selected. 7.SP.7a
   b. Develop a probability model (which may not be uniform) by observing frequencies in data generated from a chance process. For example, find the approximate probability that a spinning penny will land heads up or that a tossed paper cup will land open-end down. Do the outcomes for the spinning penny appear to be equally likely based on the observed frequencies? 7.SP.7b
8. Find probabilities of compound events using organized lists, tables, tree diagrams, and simulation. 7.SP.8
   a. Understand that, just as with simple events, the probability of a compound event is the fraction of outcomes in the sample space for which the compound event occurs. 7.SP.8a
b. Represent sample spaces for compound events using methods such as organized lists, tables and tree diagrams. For an event described in everyday language (e.g., “rolling double sixes”), identify the outcomes in the sample space which compose the event. 7.SP.8b

c. Design and use a simulation to generate frequencies for compound events. For example, use random digits as a simulation tool to approximate the answer to the question: If 40% of donors have type A blood, what is the probability that it will take at least 4 donors to find one with type A blood? 7.SP.8c

Chapter 7 Summary:
Throughout this chapter students engage in a variety of activities: gathering data, creating plots, and making comparisons between data sets. Activities are designed to help students move from experiences to general speculations about probability and number.

Section 1 begins with an exploration of basic probability and notation, using objects such as number cube (dice) and cards. Students will develop modeling strategies to make sense of different contexts and then move to generalizations. In order to perform the necessary probability calculations, students work with fraction and decimal equivalents. These exercises should strengthen students’ abilities with rational number operations. Some probabilities aren’t known, but can be estimated by repeating a trial many times, thus estimating the probability from a large number of trials. This is known as the Law of Large Numbers, and will be explored by tossing a Hershey’s Kiss many times and calculating the proportion of times the Kiss lands on its base.

Section 2 investigates the basics of gathering samples randomly in order to learn about characteristics of populations, in other words, the basics of inferential statistics. Typically, population values are not knowable because most populations are too large or difficult to measure. “Inferential statistics” means that samples from the population are collected, and then analyzed in order to make judgments about the population. The key to obtaining samples that represent the population is to select samples randomly. Students will gather samples from real and pretend populations, plot the data, perform calculations on the sample results, and then use the information from the samples to make decisions about characteristics of the population.

Section 3 uses inferential statistics to compare two or more populations. In this section, students use data from existing samples and also gather their own data. They compare plots from the different populations, and then make comparisons of center and spread of the populations, through both calculations and visual comparisons.

Terms and phrases used in this chapter are informally explained below.

VOCABULARY:

random sample – a set of data that is chosen in such a way that each member of the population has an equal probability of being selected

population – the set of possibilities for which data can be selected

independent events – events that are not affected by each other

compound events – an event made up of two or more independent events

expected value – the average value of repeated observations in a replicated experiment

frequency – the number of times that a particular value occurs in an observation

probability – the chance or likelihood that an event will occur, expressed from a scale from 0 (impossible) to 1 (certain)

relative frequency – the ratio of the frequency of an event in an experiment to the total frequency

Law of Large Numbers – the long run relative frequency of an experiment, based on a large number of trials

sample – a subset of a population collected by a defined procedure for the purpose of making inferences from the sample to the population

simulation – an experiment that models a real-life situation
probability model – a mathematical representation of a random phenomenon that includes listing the sample space and the probability of each element in the sample space
uniform probability model – when all of the outcomes of a probability model are equally likely

CONNECTIONS TO CONTENT:

Prior Knowledge
Students should be familiar with the following content from 6th grade:

- Understands that a set of data has a distribution that can be described by its center, spread, and overall shape. 6.SP.2
- Displays numerical data in plots on a number line, dot plots, histograms, and box plots. 6.SP.4
- Gives quantitative measures of center (median and/or mean) and variability (IQR and/or mean absolute deviation) 6.SP.5c
- Describes any overall patterns of data and any striking deviations from the overall pattern. 6.SP.5c
- Relates the choice of measure of center and variability to the shape of the data distribution and context. 6.SP.5d

Chapter 7 begins by reviewing standard 7.SP.5, basic probability content that was covered in Chapter 1.

Future Knowledge
This unit introduces the importance of fairness in random sampling, and of using samples to draw inferences about populations. Some of the statistical tools used in 6th grade will be practiced and expanded upon as students continue to work with measures of center and spread to make comparisons between populations. Students will investigate chance processes as they develop, use, and evaluate probability models. Compound events will be explored through simulation, and by multiple representations such as tables, lists, and tree diagrams.

The eighth grade statistical curriculum will focus on scatter plots and bivariate measurement data. Bivariate data is also explored in Secondary Math I, however, Secondary Math I, II, & III statistics standards return to exploration of center and spread, random probability calculations, sampling and inference.
### MATHEMATICAL PRACTICE STANDARDS (emphasized):

<table>
<thead>
<tr>
<th>Practice Standard</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Make sense of problems and persevere in solving them.</td>
<td>Students will make sense of probability calculations by connecting rational numbers to probabilities, and creating models to support calculations. Additionally, students will use sense-making skills to compare data sets using measures of center and spread.</td>
</tr>
<tr>
<td>Reason abstractly and quantitatively</td>
<td>Students are able to utilize the mathematics necessary to solve simple probability problems using both ratios and percents, and interpret data using appropriate measures of center and spread.</td>
</tr>
<tr>
<td>Construct viable arguments and critique the reasoning of others</td>
<td>Students are able to assess the reasonableness of their answers and will solve problems in a variety of ways, where they will be able to discuss and validate their own approaches and solutions.</td>
</tr>
<tr>
<td>Model with mathematics</td>
<td>Students will use multiple representations to model probability problems and create appropriate graphical representations for data.</td>
</tr>
<tr>
<td>Attend to precision</td>
<td>Students will identify whether or not their answer makes sense (e.g. probability values less than 0 or greater than 1 are not valid, measures of center and spread should be reasonable for the data).</td>
</tr>
<tr>
<td>Look for and make use of structure</td>
<td>Students are able to recognize the key phrases of compound probability models and use of diagrams or tables to assist with calculations and data analysis.</td>
</tr>
<tr>
<td>Use appropriate tools strategically</td>
<td>Students demonstrate their ability to select and use the most appropriate tool(s), such as diagrams, tables, lists, box plots, dot plots, etc., while solving real-life word problems.</td>
</tr>
<tr>
<td>Look for and express regularity in repeated reasoning</td>
<td>Students look for structure and patterns in real-life word problems, which will help them identify a solution strategy.</td>
</tr>
</tbody>
</table>
7.0 Anchor Problem: The Teacher Always Wins

The Teacher Always Wins Game (to be introduced by the teacher)

Why does the teacher always seem to win? Is it certain that the teacher will win? After the introduction of this activity, your job is to determine the answers to these questions, and see if you can discover the secret to the game.
Section 7.1: Probability Models to Analyze Real Data, Make Predictions

Section Overview:

This section starts with a review of concepts from Chapter 1 section 1 and then extends to a more thorough look at probability models. A complete probability model includes a sample space that lists all possible outcomes, including the probability of each outcome. The sum of the probabilities from the model is always 1. A uniform probability model will have relative frequency probabilities that are equivalent. A probability model of a chance event (which may or may not be uniform) can be approximated through the collection of data and observing the long-run relative frequencies to approximate the theoretical probabilities. Probability models can be used for predictions and determining likely or unlikely events.

There are multiple representations of how probability models can be displayed. These include, but are not limited to: organized lists (including a list that uses set notation), tables, and tree diagrams.

Students will also consider the ramifications of rounding, what it means to have “independent events,” how to create a simulation, and further explore the difference between theoretical probability and real life situations. There will be several exploration activities in the section giving students ample opportunity to discuss ideas.

Concepts and Skills to be Mastered

1. Develop a probability model and use it to find probabilities of events.
2. Compare probabilities from a model to observed frequencies; if the agreement is not good, explain possible sources of the discrepancy.
3. Understand that, just as with simple events, the probability of a compound event is the fraction of outcomes in the sample space for which the compound event occurs.
4. Represent sample spaces for compound events using methods such as organized lists, tables, and tree diagrams.
7.1a Class Activity: The Horse Race Game Revisited—Probability Basics

Note: You may wish to use ratio, decimal or percents to discuss probability and compute predictions. If you did not do 1.1.b, you should do it BEFORE this activity. Review with students the difference between saying “there is a 1 in 3 chance of drawing a red marble from this bag of red and blue marbles” and “there is 1 red marble for every 3 blue marbles in the bag.”

1. Review from Chapter 1 (1.1.b): in the Horse Race Game you predicted which horse (#2-12) would win the race. The winning horse was determined by tossing two dice and observing the sum of the die. Fill in the table below to find the possible sums of two dice.

<table>

</tbody>
</table>

Use the table to answer the following questions. Some of the questions may review Chapter 1 content.

2. What is the number of the horse that is most likely to win? Explain how you know.
   Horse #7 Seven is the sum that occurs most often.

3. How many times did that horse’s number occur in the table? 6 times

4. What is the number of the horse (or horses) that is/are the least likely to win? Both horses #2 and #12
   Remind students why there is no “1 horse.”

5. How many times did that horse(s) number occur in the table? 1 each

6. How many total outcomes are there altogether on the table? 36 outcomes

RECALL: Probability is written as a part-to-whole ratio of possible outcomes to the number of total outcomes. For example, the chances that horse #3 will win is: two possible ways to win out of thirty-six total possibilities (or 2/36.)

7. What is the probability that horse #8 will win? 5/36

In general, the “#7 horse” wins. There is a 1/6 probability of rolling a sum of 7 while all other rolls (sums) have probabilities less than 1/6. See 1.1b for more information.

Note that the word “probability” is used here. Talk about other words such as “chance” that are sometimes used instead. The word “odds” is NOT correct. Odds and probability are related but distinct numeric representations of situations.
The table shows the probabilities for each horse winning. Recall, this is called the **theoretical probability** of winning. Remind students that we didn’t actually race the horses, but we can estimate the probabilities that each one might win using the theoretical probability.

**Mathematical Notation:** the mathematical shorthand way of writing a probability looks like this: \( P(\text{horse #4 wins}) = \frac{3}{36} \) OR \( P(4) = \frac{3}{36} \) (we can also write this as a reduced fraction, decimal or percent.)

8. Fill in the table below with the theoretical probability for each horse to win. Write the values both as a fraction and as a percent. Round the percents to the nearest whole number.

<table>
<thead>
<tr>
<th>Number</th>
<th>Probability as a fraction</th>
<th>Probability as a percent</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>( \frac{1}{36} )</td>
<td>3%</td>
</tr>
<tr>
<td>3</td>
<td>( \frac{2}{36} )</td>
<td>6%</td>
</tr>
<tr>
<td>4</td>
<td>( \frac{3}{36} )</td>
<td>8%</td>
</tr>
<tr>
<td>5</td>
<td>( \frac{4}{36} )</td>
<td>11%</td>
</tr>
<tr>
<td>6</td>
<td>( \frac{5}{36} )</td>
<td>14%</td>
</tr>
<tr>
<td>7</td>
<td>( \frac{6}{36} )</td>
<td>17%</td>
</tr>
<tr>
<td>8</td>
<td>( \frac{5}{36} )</td>
<td>14%</td>
</tr>
<tr>
<td>9</td>
<td>( \frac{4}{36} )</td>
<td>11%</td>
</tr>
<tr>
<td>10</td>
<td>( \frac{3}{36} )</td>
<td>8%</td>
</tr>
<tr>
<td>11</td>
<td>( \frac{2}{36} )</td>
<td>6%</td>
</tr>
<tr>
<td>12</td>
<td>( \frac{1}{36} )</td>
<td>3%</td>
</tr>
</tbody>
</table>

This is a good opportunity to review fractions. Note that it is perfectly acceptable in probability calculations to leave the fraction in the original form because it provides information about the size of the original sample and the number of outcomes of each type.

9. Add up all the fractions. What is the total? The total is 1.

Vocabulary: explicitly discuss that the table showing the outcomes (horses #2-12) along with probabilities that add to 1 represent a **Probability Model**. The table shown above is one representation of a probability model. Other representations include ordered lists and tree diagrams. The sum of all probabilities in a probability model will be 1, or if in percents, 100%. If the values don’t add to 1 (or 100%), then you’re missing something and/or there is some problem with the way you’re calculating.

10. Add up all of the percents in the table. What is the total? 101%. Let the students think about this. Discuss why the sum is not 100%. Discuss how rounding error occurs.

11. If there are 200 races (200 rolls of the dice), how often would you predict horse #7 would win? Show all your work and explain your reasoning.

\[
(200)(\frac{6}{36}) = \frac{1200}{36} = 100/3 = 33.\overline{3} \text{ races (not a whole number), or using rounded percents: } (200)(0.17) = 34 \text{ races (a whole number).}
\]

12. Suppose the horses race…

a. …500 times, what is your prediction for how many times horse #7 will win? Show your calculations.

\[
(500)(\frac{6}{36}) = 83.\overline{3}, \text{ or using the less accurate rounded percents: } (500)(0.17) = 85.
\]

b. …1000 times, what is your prediction for how many times horse #2 will win? …horse #12 will win?

Each will equal \( (1000)(\frac{1}{36}) = 27.\overline{7} \), or about 28 times.

c. Suppose we watched the horses race 500 times. Which of the following values would be the most likely result for horse #5? 11 wins 50 wins* 100 wins 250 wins

Explain the reasoning for your choice. 50 is the closest to the value you would expect. Students should attend to the fact that winning/losing do not have equal probability. It may be useful to ask students: Why isn’t the answer 250? Horse #5 can only either win or lose, so isn’t that a 50% chance of winning? Pin down that winning and losing are not equally likely outcomes. In other words, even though there are only two outcomes possible, winning has a \( \frac{4}{36} \) chance while losing has a \( \frac{32}{36} \) chance.
7.1a Homework: Probability Problem Solving

M&M Probability (refer to the table below for amounts of colors)

1. The color mix in a large bag of M&Ms is shown in the table below. What is the total number of M&M’s in the bag? The total number of M&Ms = 220

2. Calculate the probability of drawing each of the colors. Finish the probability model by recording the experimental probability of drawing each color. Show the probabilities as both a fraction and as a percent.

<table>

<tr>
<td>Percents</td>
<td>27%</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

3. If you drew 50 M&M’s, one at a time (returning the M&M to the bag each time), how many of each color would you expect, based on the probabilities in the table above? Put your answers in the table.

<table>
<thead>
<tr>
<th>Predicted Sampling Estimate for 50 draws</th>
</tr>
</thead>
<tbody>
<tr>
<td>RED 13.64 ≈ 14</td>
</tr>
</tbody>
</table>

Remind students that the predicted numbers should add up to 50 and why this may not be the case when rounding.

4. Suppose you went to the store and bought a large bag of M&Ms. From that bag you took a sample of exactly 50 M&Ms and calculated the percent of each color in your sample. Do you think the percents would be the same as in the first table? Why or why not?

**Probability model** – a mathematical representation of a random phenomenon that includes listing the sample space and the probability of each element in the sample space.
5. **The Bag Game**

There are three bags of chips: one with 25 red and 5 blue, another with 20 red and 10 blue, and the last with 10 red and 20 blue. You’re randomly given one bag. To win the game, you must guess correctly which bag you’ve been given but you cannot see its contents.

To make your guess you are given three options:

a. Draw 5 chips and guess correctly, win $100.

b. Draw 10 chips and guess correctly, win $75.

c. Draw 15 chips and guess correctly, win $50.

d. Draw 20 chips and guess correctly, win $25.

e. Draw 25 chips and guess correctly, win $10.

Note: to plat the bag game, you draw one chip at a time, record the color, replace the chip, and then repeat.

You want to win as much money as possible. Which option do you choose for guessing which bag you’ve been given? Why? Be certain to explain all of the probabilities. Discuss with students that there is not a “right” answer. What matters is soundness of the argument. You might want to talk about insurance rates, sports, or other areas where probabilities are considered to make decisions.

6. **Rolling Doubles**

If TWO dice are rolled 36 times, how many doubles would you expect to see? What is the probability of rolling doubles with two fair die? Students may construct a table similar to the one at the beginning of the activity. Instead of listing each sum, list the dice combinations like (1,6), (2,6) etc.

**Spiral Review**

1. Write 0.612 as a percent and fraction. 61.2% 612/1000 or 153/250

2. If 4 gallons of gas cost $14.60, how much does 10 gallons of gas cost? $36.50

3. If you spin the following spinner once, what is the theoretical probability of spinning an L?

```
  P  S
  S  L
```

4. A mouse can travel 1.5 miles in ¾ of an hour. At that pace,
   a) how far can it travel in 1 hour? 2 miles
   b) how long does it take it to travel one mile? ½ an hour

Madison is riding her horse around the outside of a circular arena. She knows that 14 laps is ½ mile. What is the diameter of the arena? (Hint: 1 mi = 5280 ft)
7.1b Class Activity: Probability Models

Probability models (like “tree” models) show the outcome of random processes. A probability model includes the following:

- A listing of the sample space (all the possible outcomes.) For example, you might use set notation
  \[ S = \{ , , , , \ldots \} \], a tree diagram, a table, etc.
- Probability for each possible event in the sample space. Remember, probabilities always add up to 1.

Talk again to students about notation: set notation for a sample space appears as: \( S = \{ a, b, c, \ldots \} \). The “\( S \)” stands for “sample space”. The curly brackets enclose the possible outcomes. Each possible outcome is usually only listed once, even if it occurs more than once.

1. Suppose you are going to toss a coin and see how it lands.
   a. List the sample space using set notation. \( S = \{ H, T \} \)

   b. What is the probability for tossing a head? \( P(\text{head}) = 0.5 \text{ or } 1/2 \)

   c. What is the probability for tossing a tail? \( P(\text{tail}) = 0.5 \text{ or } 1/2 \)

   Ask students: what if you were to toss a thumb tack, what are the possible outcomes? You might also (or instead) ask: what if you were to toss a Kleenex box, what are the possible outcomes for how the box will land?

   Follow up either situation by asking if all outcomes are equally likely. The answer is NO. For the thumb tack, it might land up (on the back of the tack), sideways, or on the tip of the tack, but these are not equally likely. Likewise with the Kleenex box. Though there are 6 sides of the box, students will note that it is more likely that the box will fall on to one of the sides with the greatest surface area.

2. Consider the theoretical outcomes for tossing a fair coin 3 times.
   a. What is the sample space? Use set notation. (Hint: there should be 8 outcomes in the sample space.)
      \[ \{HHH, HHT, HTH, THH, HTT, THT, TTH, TTT \} \]

   b. What is the probability of each of the 8 outcomes? \( 1/8 \). Discuss: Since heads and tails are equally likely, each of the eight outcomes in the sample space are equally likely.

   A probability model for which all outcomes are equally likely (have the same probability) is called a \textbf{uniform probability model}. 

©2014 University of Utah Middle School Math Project in partnership with the Utah State Office of Education. Licensed under Creative Commons, cc-by.
3. Create a tree diagram to display the sample space for tossing a coin 3 times. The first branch should have two forks, one for H and one for T. Each of those has two forks (now 4 outcomes), and each of those have two forks (now 8 outcomes).

<table>
<thead>
<tr>
<th>1st Toss</th>
<th>2nd Toss</th>
<th>3rd Toss</th>
<th>Outcomes</th>
<th>Probability</th>
</tr>
</thead>
<tbody>
<tr>
<td>H</td>
<td>H</td>
<td>H</td>
<td>H HH H</td>
<td>(1/2)(1/2)(1/2)=1/8</td>
</tr>
<tr>
<td>T</td>
<td>H</td>
<td>T</td>
<td>H HT H</td>
<td>(1/2)(1/2)(1/2)=1/8</td>
</tr>
<tr>
<td>H</td>
<td>T</td>
<td>H</td>
<td>H TH T</td>
<td>(1/2)(1/2)(1/2)=1/8</td>
</tr>
<tr>
<td>T</td>
<td>T</td>
<td>H</td>
<td>T H H T</td>
<td>(1/2)(1/2)(1/2)=1/8</td>
</tr>
<tr>
<td>H</td>
<td>H</td>
<td>T</td>
<td>T HH T</td>
<td>(1/2)(1/2)(1/2)=1/8</td>
</tr>
<tr>
<td>T</td>
<td>H</td>
<td>T</td>
<td>T HT T</td>
<td>(1/2)(1/2)(1/2)=1/8</td>
</tr>
<tr>
<td>T</td>
<td>T</td>
<td>H</td>
<td>H T T H</td>
<td>(1/2)(1/2)(1/2)=1/8</td>
</tr>
<tr>
<td>T</td>
<td>T</td>
<td>T</td>
<td>T T T T</td>
<td>(1/2)(1/2)(1/2)=1/8</td>
</tr>
</tbody>
</table>

A tree diagram also helps organize information so that students can list all of the outcomes without missing any of them. Notice that a tree diagram is also handy for calculating probabilities. Since this is a uniform distribution, the chance of being on either fork is equally likely at 1/2. Therefore, the probability of HHH, or \( P(\text{HHH}) \), is \( (1/2) \cdot (1/2) \cdot (1/2) = 1/8 \).

4. Use the list or the tree diagram for 3 coin tosses to fill in the theoretical probability of the following events:

<table>
<thead>
<tr>
<th>3 heads</th>
<th>3 tails</th>
<th>2 heads and 1 tail (in any order)</th>
<th>2 tails and 1 head (in any order)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1/8 or 0.125</td>
<td>1/8 or 0.125</td>
<td>3/8 or 0.375</td>
<td>3/8 or 0.375</td>
</tr>
</tbody>
</table>

Ask the students to search for “2 heads and 1 tail (in any order)” on the tree diagram.

Ask students if they think the table shown above represent a complete probability model? How do they know? All possible outcomes are shown along with the probabilities, and the probabilities add up to 1.

5. Use all or part of the tree diagram in #4 to calculate the following probabilities:

Notation: if you see \( P(TTH) \), that is the same as writing “the probability of a tail, and a tail, and a head”

\[
\begin{align*}
P(H) &= 0.5 \text{ or } 1/2 \\
P(T) &= 0.5 \text{ or } 1/2 \\
P(HT) &= (0.5)(0.5) = 0.25 \text{ or } 1/4 \\
P(TH) &= (0.5)(0.5) = 0.25 \text{ or } 1/4 \\
P(HTH) &= (0.5)(0.5)(0.5) = 0.125 \text{ or } 1/8 \\
P(TTT) &= (0.5)(0.5)(0.5) = 0.125 \text{ or } 1/8
\end{align*}
\]

**Compound Event**: an event made up of two or more independent events.
6. Fill in the blanks for calculating probabilities for **compound events**, in other words, for two or more events occurring together. 

Suppose we call the first event \( A \), the second event \( B \), the third event \( C \), etc.

If \( P(A) = 0.5 \) and \( P(B) = 0.5 \)

then the compound probability \( P(A \text{ and } B) = \) \[ \frac{1}{2} \cdot \frac{1}{2} = 0.25 \]

If \( P(A) = 0.5 \) and \( P(B) = 0.5 \) and \( P(C) = 0.5 \)

then the compound probability \( P(A \text{ and } B \text{ and } C) = \) \[ \frac{1}{2} \cdot \frac{1}{2} \cdot \frac{1}{2} = 0.125 \]

Using words and symbols, state your conjecture for the general rule for calculating probabilities for independent compound events. In our activity above we wrote \( P(HTH) \) as shorthand for \( P(\text{head the tail the head}) \). To make a general rule, we will use \( A \), \( B \), and \( C \). Thus, a general rule might look like: \( P(A \text{ and } B \text{ and } C) = P(A) \cdot P(B) \cdot P(C) \)

Note again, that this rule is only true for independent events. It is another lesson entirely to consider compound events that are not independent. This topic is addressed in Secondary Math Vocabulary: Independent – the outcome of one event has no effect on the next event. Ask students to describe how the rule for independent compound probabilities relates to the tree diagram. One possible answer: you can find the probability of the end result (such as following the branches leading to \( HTH \)) by multiplying the probabilities along each branch. Also discuss explicitly that \( P(HTH) \) is different than \( P(THH) \) or \( P(HHT) \), but that each has the same value. If we want to find the probability of flipping two heads and one tail in three flips, any order, then we find all the ways this is possible (THH, HTH or HHT) and sum each of the three ways it can be achieved: \( 0.125 + 0.125 + 0.125 \) or \( 0.375 \).

7. Use the rule you found in the prior question to calculate \( P(HTHHH) \). \[ \frac{1}{2} \cdot \frac{1}{2} \cdot \frac{1}{2} \cdot \frac{1}{2} \cdot \frac{1}{2} = 0.03125 = 1/32 \]

Again emphasize that you are asking for heads and tails in a specific order in five flips.

8. Suppose that you have an **unfair** coin where the \( P(H) = 0.8 \) and the \( P(T) = 0.2 \). Compute the following probabilities:

\[
\begin{align*}
P(H) &= 0.8 \\
P(T) &= 0.2 \\
P(HT) &= (0.8)(0.2) = 0.16 \\
P(TH) &= (0.2)(0.8) = 0.16 \\
P(HTH) &= (0.8)(0.2)(0.8) = 0.128 \\
P(TTT) &= (0.2)(0.2)(0.2) = 0.008
\end{align*}
\]

**Note:** This is not a uniform distribution because the outcomes are not equally likely.

9. Compare the calculations that you used for the fair coin and the unfair coin. How are the calculations similar? How are they different? You use the same method of multiplying the probabilities together, but you change the probabilities to \( P(H) = 0.8 \) and \( P(T) = 0.2 \)

Talk with students about how they might continue to use the tree diagram to calculate compound probabilities for an unfair coin. Help them understand that the tree diagram is still useful, you just have to change the probabilities. The outcomes are no longer equally likely.
7.1b Homework: Probability Models

Suppose you rolled a dice and tossed a coin at the same time.

1. Create a probability model, BOTH a tree model and table, for rolling a die once then tossing a coin once.

2. How many total outcomes are represented by either the tree or table model? $6 \cdot 2 = 12$

3. What is the sample space for the possible outcomes? List the sample space using set notation.
   $S = \{ __, __, __, \ldots \}$ $S = \{1H, 1T, 2H, 2T, 3H, 3T, 4H, 4T, 5H, 5T, 6H, 6T\}$. Can be in any order, and can be described using words rather than numerals and letters.

4. What is the probability for each outcome in the sample space? Write the probabilities both as a ratio and as a percent.

5. If you collected experimental data from rolling a die and then tossing a coin, would the calculated probabilities from the experiment match the theoretical probabilities? Why or why not?
Spiral Review

1. Rewrite the following part:part ratio as part:whole ratio.
   a. The ratio of boys to girls in Gabrielle’s family is 3:8. 3:11

2. Solve the following proportion equation: \( \frac{x}{5} = \frac{4}{10} \). \( x = 2 \)

3. Simplify each.
   a) \(-6(-5)\) 30  
   b) \(-10 \cdot 31\) -310

4. Kim had a bag with red, green, purple, yellow and orange marbles. The following table shows what color she drew each time.

<table>
<thead>
<tr>
<th>Draw</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
<th>7</th>
<th>8</th>
<th>9</th>
<th>10</th>
</tr>
</thead>
<tbody>
<tr>
<td>Result</td>
<td>red</td>
<td>orange</td>
<td>purple</td>
<td>orange</td>
<td>orange</td>
<td>purple</td>
<td>yellow</td>
<td>green</td>
<td>red</td>
<td>green</td>
</tr>
</tbody>
</table>

   a) Find the experimental probability of drawing a red marble. \( \frac{1}{5} \)

   b) If there are 100 marbles in the bag, how many of them do you think are red? Justify your answer. 20

5. If \( \angle N \) is vertical to \( \angle M \), and \( m\angle M = 98^\circ \) and \( m\angle N = (6x + 2)^\circ \), the \( x \) must be _______________.

7.1c Class Activity: Rolling Along

Can you roll your tongue? Some people can roll their tongue, some cannot. Approximately 1 out of every 3 people cannot roll their tongue. Depending on the source, the estimated proportion of people in the population who cannot roll their tongues is between 19-35%.

Consider: Ria is doing a survey on the number of people with different genetic traits. She asks people, one at a time, if they can roll their tongue. Ria was surprised that she asked 5 people before she found someone who wasn’t able to roll their tongue. **Does this mean the statement “approximately 1 out of 3 people cannot roll their tongue” must be false? Is it unusual that after surveying 5 people she did not find anyone who could not roll their tongue?**

To answer this question we can do a simulation of Ria’s experiment.

**Simulation** – an experiment that models a real-life situation

Select a method to simulate a 1 out of 3 chance (die, slips of paper, software, etc.). Run the simulation until you get the “1 out of 3” chance you’re looking for. For example, there is a 1 out of 3 chance of rolling a 1 or 2 with a six sided die. **One simulation is the number of times it takes to roll a 1 or 2 with a die.** Record a tally mark under the number of times it takes to get the 1 or 2 in the table below. Run the simulation 20 times recording your result each time. Once you’ve done your 20 simulations, compile your results with two other people so that you have 60 total simulations. Record the data in the table.

<table>
<thead>
<tr>
<th>Number of attempts</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
<th>7</th>
<th>8</th>
<th>9</th>
<th>10</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record a tally</td>
<td>7</td>
<td>4</td>
<td>3</td>
<td>2</td>
<td>1.3</td>
<td>0.9</td>
<td>0.6</td>
<td>0.4</td>
<td>0.3</td>
<td>0.2</td>
</tr>
<tr>
<td>Combined Results</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>(60 simulations)</td>
<td>20</td>
<td>13</td>
<td>9</td>
<td>6</td>
<td>4</td>
<td>3</td>
<td>2</td>
<td>1</td>
<td>0.8</td>
<td>0.5</td>
</tr>
<tr>
<td>% out of 60 simulations</td>
<td>20/60</td>
<td>13/60</td>
<td>9/60</td>
<td>6/60</td>
<td>4/60</td>
<td>3/60</td>
<td>2/60</td>
<td>1/60</td>
<td>0.8/60</td>
<td>0.5/60</td>
</tr>
<tr>
<td></td>
<td>33.33%</td>
<td>22.67%</td>
<td>15%</td>
<td>10%</td>
<td>6.67%</td>
<td>5%</td>
<td>3.33%</td>
<td>1.67%</td>
<td>1.33%</td>
<td>0.83%</td>
</tr>
</tbody>
</table>

1) Based on the combined trials, calculate the probability that it would take 5 or more attempts.
   Theoretically, P(5 or more attempts) = 0.1975. When students combine their results to obtain 60 total trials, they should get a value of around 11 where it took 5 or more attempts to get a success, although student results will vary. As an example, this table shows expected values for up to 10 attempts. Summing the values found in the table for 5 or more attempts: 4 + 3 + 2 + 1 + 0.8 + 0.5 = 11.3. Thus students would expect around 11 of the 60 trials to take five or more attempts.

2) Were Ria’s results unusual? Write a paragraph summarizing your conclusion, based on the simulation. No, Ria’s results are not terribly unusual. The simulation shows that results like this could happen in slightly 2-3 times out of 20, and about 11 times out of the combined 60 attempts. A discussion of the variability of the students’ results is an important concept in statistics, and in simulation.
3) Suppose the ratio of left handed people to right handed people is 1:10. Create a simulation for the number of trials if takes to get a left handed person.

4) Suppose that 60% of students choose chocolate ice cream, 30% choose vanilla ice cream, and 10% choose strawberry ice cream. Create a simulation for the number of trials it takes to get a student to choose chocolate, vanilla and strawberry ice cream.

**Law of Large Numbers** – the long run relative frequency of an experiment, based on a large number of trials.
7.1c Homework: Finding Probability

The colors of M&Ms in a large bag are distributed according to the probabilities shown in the table:

<table>
<thead>
<tr>
<th>Color</th>
<th>Brown</th>
<th>Red</th>
<th>Yellow</th>
<th>Green</th>
<th>Orange</th>
<th>Blue</th>
</tr>
</thead>
<tbody>
<tr>
<td>Probability</td>
<td>0.25</td>
<td>0.25</td>
<td>0.20</td>
<td>0.10</td>
<td>0.10</td>
<td>?</td>
</tr>
</tbody>
</table>

1. Finish the table above by finding \( P(\text{blue}) \).

2. Suppose you draw an M&M out of the bag and record the color. List the sample space using set notation.
   \[ S = \]

3. What is required in order to have a complete probability model?
   All of the possible outcomes listed, and probability of each outcome, and the probabilities adding up to 1.

**Compound Probabilities of M&M Colors**

4. Compute the following theoretical probabilities. Use the probabilities from the M&M table given above.

   \[ P(\text{red and yellow}) = (0.2)(0.2) = 0.04 \]

   \[ P(\text{brown, orange}) = \]

   \[ P(3 \text{ blues in a row}) = \]

**Simulation**

5. Your favorite M&M’s are red, so you want to create a simulation for modeling the drawing of red M&M’s from a bag with the color probabilities as listed above. Describe a simulation. Remember: you are only trying to simulate drawing a red M&M.

   **Hint:** From the table above, \( P(\text{red}) = 0.25 \). Theoretically in four tries, one will be red.
Spiral Review

1. If you flip a penny three times, what is the probability of getting two tails and one head in any order?

2. The scale factor $GEL$ to $HOP$ is $\frac{1}{6}$. If $OP$ is 30, what is the length of $EL$?

3. Daniel got 4 out of every 5 questions correct on a recent multiple choice test. If he got 64 questions correct, how many did he miss? $80 - 64 = 16$ Daniel missed 16 questions.

4. Find the sum or difference for each:
   a. $\frac{5}{3} - \frac{3}{4} + \frac{11}{12}$
   b. $\frac{-2}{3} + \frac{1}{4} - \frac{5}{12}$

5. Paul left a $25 tip for the waiter at a restaurant. If the tip was 25% of the bill, how much was the bill? $100$
7.1d Class Activity: More Models and Probability

Win the Spin!
Determine the probability that Player 1 wins the spin (highest number wins). Player 1 uses spinner A and Player 2 uses spinner B. Assume that the areas on each spinner are equal in size.

1. Create a probability model for the outcomes of the “Win the Spin” game, using a tree diagram. Students

<table>
<thead>
<tr>
<th>Outcomes</th>
<th>Probability</th>
</tr>
</thead>
<tbody>
<tr>
<td>1, 3</td>
<td>(1/3)(1/3) = 1/9</td>
</tr>
<tr>
<td>1, 4</td>
<td>(1/3)(1/3) = 1/9</td>
</tr>
<tr>
<td>1, 8</td>
<td>(1/3)(1/3) = 1/9</td>
</tr>
<tr>
<td>5, 3</td>
<td>(1/3)(1/3) = 1/9</td>
</tr>
<tr>
<td>5, 4</td>
<td>(1/3)(1/3) = 1/9</td>
</tr>
<tr>
<td>5, 8</td>
<td>(1/3)(1/3) = 1/9</td>
</tr>
<tr>
<td>9, 3</td>
<td>(1/3)(1/3) = 1/9</td>
</tr>
<tr>
<td>9, 4</td>
<td>(1/3)(1/3) = 1/9</td>
</tr>
<tr>
<td>9, 8</td>
<td>(1/3)(1/3) = 1/9</td>
</tr>
</tbody>
</table>

Total: 1

2. How many possible outcomes are there? How do you know? 3 • 3 = 9 outcomes or students could count the outcomes from the tree diagram.

3. What is the probability of each of the outcomes? How do you know? 1/9. A possible answer: the probabilities are equal because the areas of each outcome on the spinner are equal at 1/3. Since the game requires each of the two spinners to be used once, then each of the outcomes from the two spins have a probability of (1/3)(1/3) = 1/9.

4. What is the probability that Player 1 will win? How do you know? Player 1 wins 5 times out of the 9 outcomes, or 5/9. Refer to the outcomes on the probability model.

5. What is the probability that Player 2 will win? How do you know? Player 2 wins 4/9 times.

6. What is the probability of a draw (tie)? How do you know? $P(\text{tie}) = 0 \text{ There are no ties, because the spinners have different numbers. Make note that the probability of an impossible event is 0. Probabilities have values between 0 and 1.}$

7. Is this a fair game? Why or why not? No, Player 1 has a higher probability (5/9) of winning.
8. If you were to play the game, your outcome would not necessarily match the probabilities above. Explain why this is true. The students will probably mention that there is always variability.

**Odd or Even Game**

For a different game Player 1 and 2 each spin once (Spinner A, then B) and add the numbers. If the sum is odd, then Player 1 gets a point. If the sum is even, then Player 2 gets a point. Review with students: odd number + odd number = even number; odd number + even number = odd number; even number + even number = even number; and even number + odd number = odd number.

9. Create a probability model for the outcomes of the “Odd or Even” game, using a tree diagram.

10. Use the tree diagram to figure out if the game is fair or not. Explain. The game is not fair. \( P(\text{even}) = \frac{3}{9} \), so Player 1 only wins 3 times out of 9.

11. Use the rule for calculating compound probability to calculate the probabilities of the different combinations of the spins for Players 1 and 2. Show all your work.

\[
P(\text{odd, even}) = (\frac{3}{3})(\frac{2}{3}) = \frac{6}{9}. \text{ Verify with the tree diagram.} \quad \text{Player 2 will win these.}
\]

\[
P(\text{odd, odd}) = (\frac{3}{3})(\frac{1}{3}) = \frac{3}{9}. \text{ Verify with the tree diagram.} \quad \text{Player 1 will win these.}
\]

\[
P(\text{even, odd}) = 0(\frac{1}{3}) = 0. \text{ Verify with the tree diagram.}
\]

\[
P(\text{even, even}) = 0(\frac{2}{3}) = 0. \text{ Verify with the tree diagram.}
\]
1. The spinner at right is spun twice. List the sample space for the possible outcomes from two spins. Use set notation. (Hint: there are 9 outcomes)

\[ S = \]

2. Are all the outcomes in the sample space equally likely? Why or why not?

3. How might you figure out the number of outcomes without making a list or diagram? Explain.

The first spin has 3 different outcomes. Each one of those has 3 different outcomes paired with it for the second spin. So \(3 \times 3 = 9\). This may cause confusion for some students. Discuss how the right red and then blue is the same outcome as the left red and then the blue, i.e. it is \(P(\text{red, blue})\). However, it is different than \(P(\text{blue, red})\) and that outcome can happen by first spinning a blue and then the red on the right or left. It might help students to think about the entire top half of the spinner as red rather than thinking about it as two different areas.

4. Create a probability model for the outcomes for spinning the spinner twice (organized list, tree diagram, or table) to show all possible outcomes and probabilities from two spins of the spinner.

5. Fill in the spaces below and make a conjecture about a rule for the number of possible outcomes for compound events.

If there are 3 possible outcomes in the first event, and 2 possible outcomes in the second event, then there will be ______ possible outcomes in the compound event. \(2 \cdot 3 = 6\)

If there are 5 possible outcomes in the first event, and 3 possible outcomes in the second event, then there will be ______ possible outcomes in the compound event.

If there are “\(a\)” possible outcomes in the first event, and “\(b\)” possible outcomes in the second event, then there will be ______ possible outcomes in the compound event.
6. Examine the model you created above to determine these probabilities.
   a. \( P(\text{red, red}) = \left(\frac{1}{2}\right)^2 = \frac{1}{4} \)

   b. \( P(\text{one red and one green, in any order}) \)

   c. \( P(\text{blue, red}) \) Note: blue must come first.

7. Create a probability game for each spinner. Design the spinners to make one game fair and the other unfair. Write the rules to tell how to play each game.

   ![Spinners](image)

<table>
<thead>
<tr>
<th>Game 1 Rules</th>
<th>Game 2 Rules</th>
</tr>
</thead>
</table>

8. Explain the probability of winning each game and why the game is fair or unfair.

**Extra Challenge: Spinners for Math Day**

Howard is in charge of the Spinner Game for the Math Fair. There will be about 300 people at the fair and he believes everyone will buy a ticket to play the Spinner Game. The school wants to raise money for some math software. Spinner tickets cost $1. Winners of the spinner game will be given cash prizes. Hal wants to make $100 profit from the game.

Design a plan that should net Hal $100 from the Spinner Game. Be sure to show the spinners you would recommend and the rules you think would work. Explain why your spinners and rules make sense for this context.
Spiral Review

1. Simplify each:
   a. \(-6(-5)\) \quad 30
   b. \(-16(-3)\) \quad 48
   c. \(-10 \cdot 31\) \quad -310
   d. \(-89 + (-6)\) \quad -9

2. Kelsey puts each letter of her name on a piece of paper. What is the probability that she will draw a K and an E in any order?

3. Order the following rational numbers from least to greatest. \(\frac{12}{3}, -4.5, \frac{-14}{3}, -0.94, \frac{-14}{3}, -4.5, -0.94, \frac{12}{3}\)

4. Matthew wants a bigger cage for his bearded dragon. He wants the length to be 2 inches less than twice the width. If the perimeter of the cage should be 104 in, what dimensions should the cage be?

5. Use the diagram at the left to find the angle measures.
**Long run relative frequency:** the probability of an outcome obtained after many trials

**Variable (the verb, not the noun):** not consistent or having a fixed pattern; liable to change

**Experimental Probability:** the ratio of the number favorable outcomes to the total number of trials, from an actual sequence of experiments

**Theoretical Probability:** the probability that a certain outcome will occur, as determined through reasoning or calculation
7.1e Class Activity: Probability of a Kiss

When you toss a coin, it will either land heads or tails. That isn’t very interesting. But suppose you toss a Hershey’s Kiss in the air, and then observe how it lands. That is much more interesting.

The sample space for tossing a Kiss has two possible outcomes: \( S = \{ \text{base, side} \} \). “Base” means the Kiss landed on the flat base, and “side” means the Kiss landed on its side.

What is the probability for each outcome? We don’t know the answer. First we must do an experiment, and then calculate the experimental probability that the Kiss will land on its base, \( P(B) \).

1. Define “long run relative frequency”. The probability of an outcome obtained after many trials.

2. Make a guess for the probability that a Kiss tossed in the air will land on its base:
   \[ P(B) = \text{Student answers will vary, most students might think the Kiss will land more frequently on the base, but actually it will land more frequently on the side. There is more surface area on the side than the base. In past trials done by students, the probability of landing on the base was always less than 0.5, sometimes about 0.3} \]

3. Record the results of your experiment in the table after each toss and calculate the experimental probability after each trial. Notice that the probabilities are calculated from:
   \[ \text{(Base running total)/(trial number).} \]

4. Make a plot of your results by plotting the trial number against the experimental probability. Connect the points from trial 1, to trial 2, to trial 3,…and end with trial 30.

**Hint:** Have students fill in the outcomes column then complete the running total and experimental probability.

<table>

5. What is the experimental probability of a Kiss landing on its base after 30 trials for your experiment? 
   \[ P(B) = \quad . \]

6. Compare the value for the experimental probability at Trial 2, compared to Trial 20. Which value was closer to the final experimental value you found at Trial 30?

7. Examine the appearance of the plot. Why is the plot so variable at the beginning compared to at the end?

8. Why is it important to perform many trials in an experiment, and not just a few?
Probability of a Kiss: Graph your results below. Draw lines between the points when you are finished.
7.1e Homework: Experimental Probabilities

1. Choose an object that has two outcomes when tossed, such as a spoon (face up or face down) or a marshmallow (circular base or side.) Use the techniques from the class activity to find the experimental probability that the object will land on one of the sides.

Plot the data, using the same graph as you used for the class activity. However, plot the outcomes for the homework using a different color, and then label it.

Graph your results of # 1 below. Draw lines between the points when you are finished.
Spiral Review

1. Estimate by rounding to the nearest integer. \( \frac{3}{3} \approx 1 \) \( \frac{3}{4} \approx 0.75 \). Approximate values are \( 1 \) and \( 0.75 \). Is your answer an over estimate or under estimate, explain? Under estimate.

2. David is in a submarine at 200 feet below sea level. Casey is above him in a helicopter at 5,900 feet altitude. How far apart are David and Casey? \( 5,900 - (-200) = 6,100 \text{ ft} \).

3. Find each difference without a model.
   a. \( 16 - 29 \)
   b. \( 2 - 8 \)
   c. \( 5 - (-3) \)
   d. \( -90 - 87 \)

4. Given the measures of the following angles, identify the possible angle relationship(s).
   a. \( m \angle UTS = 9^\circ \) and \( m \angle DCB = 9^\circ \)
   b. \( m \angle BCD = 71^\circ \) and \( m \angle PSV = 109^\circ \)
   c. \( m \angle PSV = 60^\circ \) and \( m \angle GFE = 30^\circ \)

5. A baby toy has rings with a radius of 3 inches. What is the circumference of the rings?
7.1f Optional Class Activity: Free Throws or Monty Hall

Activity 1: Free Throws—Will We Win?
You are the coach in the final state basketball championship game; your team is losing by one point. The other team has the ball. You have one of your players foul the person with the ball from the other team. The player from the other team will now shoot two free throws. After the free throws, there will only be enough time to quickly get off a three point shot. The player at the foul line has a free throw percentage of 60%. Your best three point shooter is only a 25% shooter at any three point range.

Your task is to run a simulation to better understand the probability of winning the game.

Using spinners, simulate the situation (spinner can be made out of paper or use internet based spinners, e.g. http://www.mathsisfun.com/data/spinner.php).
- Spin and record the result of the spin for each of the two free throws.
- Spin and record the result of the one three point shot.
- Record if you would win, lose, or tie.
- Repeat this process 10 times.

1. Based on your simulation, what are your chances for winning?

2. What is the theoretical probability for a win, loss and tie?

<table>
<thead>
<tr>
<th>Free Throws</th>
<th>3-point Shots</th>
<th>Win, Lose, or Tie</th>

</tr>
</tbody>
</table>

Free Throws

- 60% make
- 40% miss

Three point shot

- 75% miss
- 25% make
Activity 2: The Monty Hall Question

In the game show Let’s Make a Deal, Monty Hall would sometimes show three doors to a contestant. He then informs the contestant that a valuable prize is hidden behind one of the three doors. The contestant would be asked to pick a door. After the contestant chooses a door (without opening), Monty then removes from play one of the doors where the prize is NOT HIDDEN. There are now 2 doors remaining, one of which has the prize. The contestant has already chosen one of these two doors. At this point, Monty gives the contestant the option of switching doors or remaining with his/her original choice.

Which statement below do you think is true:

- The probability of getting the prize is greater by switching doors.
- The probability of getting the prize is greater by not switching doors.
- It doesn’t matter.

a. What is your conjecture? Explain.

See: http://betterexplained.com/articles/understanding-the-monty-hall-problem/ for an explanation of the problem and an online simulation. You will want to demonstrate a few rounds of the simulation below so that students understand how to run it. Another option is to use an online simulation as in the link.

b. Run a simulation to see if there is a difference in the probabilities between staying with the same door or switching. Keep track of the results.
- “Monty” rolls a die out of the contestant’s view. If the die reads 1 or 2, then the prize (you can use a paper clip or a quarter to represent the prize) is placed behind Door 1. If the die reads 3 or 4, place the prize behind Door 2. If the die reads 5 or 6, place the prize behind door 3.
- The contestant rolls a die. The roll of the die will decide which door the contestant chooses. Use the same numbers as above.
- “Monty” removes from play one of the doors where the prize is NOT HIDDEN. The contestant is asked to remain with the original choice or switch.
- For the sake of consistency, have the contestant REMAIN with the original choice (no switch) for a set number of times. Later, the contestant ALWAYS SWITCHES for an equal number of times.
- “Monty” reveals where the prize is, and the recorder writes down the results in the appropriate column.

c. What are your conclusions?

d. Combine your results with those of the other groups assigned to this problem. What are your conclusions?

e. Explain the results of the game simulation.
7.1f Optional Homework Project: Mickey Match

At the school fundraiser there are two games with prizes. For Game 1 the prize is a Disney decal. For Game 2 there are two different prizes, a t-shirt or a day pass for four to Disneyland. Game 1 costs $1 to pay while game 2 costs $5 to play.

The game is played by picking cards without seeing what is written on the card. The cards are:

| Mickey | Mouse | Disney | Land |

The cards are placed in two bins, as shown below:

<table>
<thead>
<tr>
<th>BIN 1</th>
<th>BIN 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mickey Mickey</td>
<td>Mouse Mouse</td>
</tr>
<tr>
<td>Mickey Mickey</td>
<td>Mouse Mouse</td>
</tr>
<tr>
<td>Disney Disney</td>
<td>Mouse Land</td>
</tr>
<tr>
<td>Mickey Mickey</td>
<td>Mouse Mouse</td>
</tr>
<tr>
<td>Mickey Mickey</td>
<td>Mouse Mouse</td>
</tr>
<tr>
<td>Disney Disney</td>
<td>Mouse Land</td>
</tr>
</tbody>
</table>

Game 1: To win a Disneyland decal, you pick a card from the left bin. If you pick “Disney” you win a decal. What is the probability of winning a decal? $2/6 = 1/3$

Game 2: To play game 2 you must draw one card from Bin 1 and one from Bin 2. Prize options:

Option 1: If you draw Mickey + Mouse, you win the t-shirt.
Option 2: If you draw Disney + Land, you win a day pass for four to Disney Land.
Option 3: If you draw Disney + Mouse or Mickey + Land, you go home with no prize.

Multiple Representations: What is the sample space? Create an organized list, a tree diagram, or a table to see all the possible outcomes.

List:

$S = \{\text{Mickey + Mouse, Mickey + Land, Disney + Mouse, Disney + Land}\}$

Note that in the sample space the duplicates are not listed. However, students need to be aware that there are duplicates. Prompt the students by asking the number of outcomes for each of the elements in the sample space.
1. Probability Distribution: Find the probability for each outcome and add to your list, table, or tree diagram.

\[
\begin{align*}
\text{Mickey + Mouse} & \quad \frac{20}{36} \approx 0.56 \\
\text{Mickey + Land} & \quad \frac{4}{36} \approx 0.11 \\
\text{Disney + Mouse} & \quad \frac{10}{36} \approx 0.28 \\
\text{Disney + Land} & \quad \frac{2}{36} \approx 0.06
\end{align*}
\]

Note that the sum of the probabilities for each outcome are 1 (or 100%).

2. What is the probability for winning a t-shirt? approximately 0.56, or 56%

3. What is the probability for winning a day pass for four to Disney Land? approximately 0.06, or 6%
### 7.1g Self-Assessment: Section 7.1

Consider the following skills/concepts. Rate your comfort level with each skill/concept by checking the box that best describes your progress in mastering each skill/concept. Sample problems can be found on the following page.

<td>I understand the probability of a compound event is the fraction of outcomes in the sample space for which the compound event occurs. I can compare this to probability of simple events.</td>
</tr>
</tbody>
</table>
Sample Problems for Section 7.1

1. For each of the following situations, create a probability model, showing possible outcomes. Then find the probability of the given event.
   a. Sylvia has a collection of books. She has 30 reference books, 18 nonfiction books, and 64 fiction books. Find P(fiction book).
   b. The spinner illustrated to the right is spun twice. Find P(white, black).

2. Don rolled a two on a fair twenty-sided die seven times out of 80 rolls. Would you expect this result? Why or why not?

3. Represent the sample space for each of the following events. If possible, use various methods for representing the same space.
   a. Sum from rolling a six-side die twice
   b. Flipping a quarter four times
   c. Choosing an outfit out of a plaid, stripped or solid shirt and jeans, khakis or shorts

4. Crysta puts each letter of her name on a piece of paper. What is the probability that she will draw a C and an A in any order?
Section 7.2: Use Random Sampling to Draw Inferences about a Population

Section Overview: In this section students will be looking at data from samples and then making inferences from the samples to populations. Students will utilize graphs of data along with measures of center and spread to make comparisons between samples and to make an informal judgment about the variability of the samples. After examining the samples, students will actually make conclusions about the population.

It is important that students think about the randomness of a sample as well as how variations may be distributed within populations. These ideas are quite sophisticated. Activities within this section are designed to surface various ideas about sampling. Teachers, students and parents are strongly encouraged (as always) to review the mathematical foundation for a more in-depth examination of the topics within this section.

Concepts and Skills to be Mastered
1. Use random sampling to obtain a sample from a population.
2. Understand that random sampling procedures produce samples that can represent population values.
3. Create appropriate plots of collected data to provide a visual representation of the samples.
4. Compare samples of the same size from a population in order to gauge the variation in the samples. Use this variation to form an estimate of range of where a population value might lie.
5. Make predictions about a population, based on the samples.
7.2a Class Activity: Getting Your Opinion

**Activity Description:** Before starting the surveys, ask students to pretend like you are a rich teacher! Because you are so rich, you are going to take your entire class on a fabulous trip, all expenses paid. Pick two destinations for your class based on what you think might be appealing to very different parts of your class; for example either the Super Bowl or to a Broadway play in New York; the Olympics or Disney Land; an African Safari or a trip to Europe; an after school dance or after school movie, etc. In order to make it even more appealing, discuss with students the pros of each trip. Don’t let them campaign for either of the options. Then say: “The whole class will go to either ________, or to ________. In order to find out what the class prefers, I am going to take a survey, but I am NOT going to ask everyone. I’m just going to survey a representative sample of the class.” Tell students that they can’t say their preference out loud. They must vote silently on a ballot (a piece of paper).

Your teacher will describe an amazing proposal and then ask which one you’d prefer. See activity description above.

Preparation: cut up sheets of paper into ballots. You’ll need about 8 ballots per survey round. Use the ballots to collect opinions using the four survey samples as described below. Prepare for survey #4 by making a copy of the class roll, and cut it up so that there is one student’s name on each slip of paper. Place the names in a bowl or cup, and stir the names up.

**Teacher: look at the sampling methods for each survey and determine if the suggestion is right for your class. You may determine that a different criteria would be better for your students.**

**Survey 1:** Do you think that survey #1 represents the opinions of the class? Why or why not?
Say: “This survey will include all the people in class who have hair that is longer than their shoulders.” Hand out survey papers to only those people. Ask students to choose the activity they prefer. Collect and share the results. Students may say that this sample didn’t represent the population/class, in fact the sample will usually have a disproportionate number of girls so they are likely correct. Allow students the opportunity to discuss the bias in this survey method and what that will do to the results.

**Survey 2:** Do you think survey #2 represents the opinions of the class? Why or why not?
Say: “This survey will include people who are wearing earrings.” Hand out survey papers to only those people. Ask students to choose the activity they prefer. Collect and share the results. This survey method likely also has the same bias as above (more girls in it than boys). Discuss the bias in this survey and what it will do to the results. At this point, the boys might be getting a little upset, so tell them you’ll use a method that includes more boys.

**Survey 3:** Do you think survey #3 represents the opinions of the class? Why or why not?
Say: “This survey will include people who have shoes with laces.” This may result in more male students than female. Discuss with students if the sampling is representative of the class. Discuss biases in this method—for example, people in warmer climates (e.g. Southern Utah, Hawaii, etc.) may wear sandals or girls may be less likely to have shoes with laces. Tell them you are going to make one more effort to get a good representative survey.

**Survey 4:** Do you think survey #4 represents the opinions of the class? Why or why not?
Say: “This survey will include people who are wearing green.” Help students distinguish between “random” and “bias.” In the above three surveys, the sampling is not random because the probability of being chosen is not uniform. Samples that are not random, may be biased—as each of the above are. Survey 4 is also not random, but is less likely to be biased (unless green has some significance that day). When we survey, we want the sampling to be random so that it will be unbiased. This is a requisite for the mathematics.

**Survey 5:** Do you think survey #5 represents the opinions of the class? Why or why not?
Say: “This survey method will include ___ people in the class. In this bowl/cup is the name of every student in the class. I will draw their names randomly from it for the survey.” Survey about 10-15 students. Collect and share the results. Ask students to respond to the question prompt above. This method should be the least biased, and most representative of the class opinion. Ask students why this method is the least biased. Discuss why you shouldn’t trust surveys that aren’t based on random samples. Which of the five surveys is likely to be most representative of the class opinion? Explain your reasoning.

After the activity you may want to refer to question #3 in the homework, **Inquiring Students Want to Know**, and allow time for students to design their data collection.

**Vocabulary that should be discussed during this lesson: population, sample, random sample.**
7.2a Homework: Getting Your Opinion

1. You want to determine the most popular brand of shoe among students in your school. Which of the following samples would provide a good representative sample? Explain your choice, and why you didn’t choose each of the others.
   a. Ask every tenth student who comes into the school.
   b. Ask ten of the girls on the basketball team.
   c. Ask all the students in your class.
   d. Ask ten of your friends.

2. You are trying to find out who might come to an evening school play performance. Which of the following samples would provide a good representative sample of the community around the school? Explain your choice, and why you didn’t choose the others.
   a. Ask fifty people at the local grocery store.
   b. Ask five adults from several randomly selected streets around the school area.
   c. Call random names from the school telephone directory.
   d. Place questionnaires at local stores with a sign asking people to fill them out and drop in a box.

   The least biased method of collecting a sample is (b), because this would represent a random sample of people in the school area. The method in (a) only asks people in grocery stores, and they might have different opinions from people who don’t go to grocery stores. The method in (c) might seem really good, but it leaves out people who don’t have their phone numbers listed in a phone book. The method in (d) will only sample the people who care enough to fill out the questionnaire, leaving out busy people, or people who don’t see the questionnaire.

3. Inquiring Students Want to Know! What are you and other students thinking about? Make a list of topics of interest to you and students in your school. For example: What college do students want to attend? Would students prefer starting school early in the morning and getting out early or starting school later in the morning and then staying later in the afternoon? Etc. Choose a question and design a sampling method for collecting data from 10 or more randomly selected students. Then collect the data. Write a paragraph describing the results, and why your method is or isn’t a representative sample from the population.
Spiral Review

1. Lisa owes her mom $78. Lisa made four payments of $8 to her mom. How much does Lisa now owe her mother? $-78 + 4(8) = -46$ Lisa owes her mom $46.

2. Kaylee’s Bakin’ Kitchen sells fresh bread. The graph to the left shows batches of bread she can make and how much flour it takes. Is it a proportional relationship? If it is, estimate the unit rate? Yes, 7 cups per batch.

3. What is the scale factor that takes \(\triangle XYZ\) to \(\triangle ABC\)? 

\[ \frac{1}{3} \]

4. Dave is thinking of his favorite number. He tells you that it is one more than three times Emma’s favorite number. The sum of their two numbers is 17. What are Dave’s and Emma’s favorite numbers?

5. Harry’s football team loses 13 yards on one play. On the next play, the quarterback throws to a receiver for a gain of 13 yards. What was the change in their position?
7.2b Class Activity: Cool Jelly Beans!
7.2b Class Activity: Cool Beans!

The big election in Jelly Town is coming in November! The Jelly Beans living in Jelly Town (the bag) will cast a vote, either for Limey or for Grapey Bean. Up until now, Limey Bean and Grapey Bean have been tied in the polls. Limey Bean decided that if she wanted to win the election, she needed to do something drastic! So in October she came up with a new campaign slogan “I promise free sunglasses for every Jelly Bean!” Will her new slogan change the way the beans vote? She hired teams of experts to survey the population and answer this question.

The student groups in class are the experts hired by Limey Bean.

Create a dot plot with your group’s data.

Now that Limey Bean is using the new campaign slogan, there are three possibilities for election results:
a) The new slogan may have made no difference, Limey Bean and Grapey Bean could still be tied.
b) The new slogan may have backfired, so that voters now prefer Grapey Bean.
c) The new slogan may have worked as Limey Bean hoped, so that voters now prefer her over Grapey Bean.

1. Which of the three possibilities (a, b, or c) do your samples support? Justify your answer using your team’s survey results. As a hint to students, ask them to find the location on their dot plot representing a tie between Limey and Grapey (at 5, where the number of lime = grape). If the majority of surveys show Limey getting more votes, then it is more likely that she will be the winner of the election. Note also that it is possible for sample results to show Grapey getting more votes some of the time. It is possible (but not likely) to get a sample with more grape beans than lime.
2. Consider your team’s survey results. How many of the samples had more votes for Limey Bean? How many samples showed a tie? How many showed more votes for Grapey Bean? Identify the meaning for specific points on the plots. For example: What does a value of 9 represent? (Limey wins.) What does a value of 4 represent? (Grapey wins.)

3. Based on your samples, find the percent of surveys where Limey Bean had the most votes. Do you think you have enough evidence to declare the winner? Explain why or why not. Most dot plots should show very few results with Grapey winning. Assuming the sampling was not biased (no one looked at the beans or miscounted), it is justifiable to say: “If the election were held today, it is most likely that Limey Bean will win.” You can’t say you are certain Limey Bean will win, because of the variability, and because the election is still a month away (it is hypothetically October). You can only say that the chances for Limey Bean winning are pretty good.

4. How variable were the results of your samples? In other words, what was the highest number of green beans recorded from any survey, and what was the lowest number of green beans recorded from any survey? Refer to the numbers found in the table on the first page of the activity. As seen in the table it is highly unlikely to get a sample with only 0, 1, 2, or 3 green beans. Ties happen about 2 out of 20 times or 10% of samples. In large classes with lots of samples, you should see a few 4’s and a few 10’s. Most survey results will range from 5 through 9.

5. Based on your answer above, is it possible that Limey Bean will lose the election? Is it probable? “Possible” and “Probable” are two different things. Almost anything is possible. It is possible to win the lottery. However, it isn’t probable (i.e. likely). So, based on these samples, it is possible Limey will lose the election if it were held today, but it isn’t probable.

6. Summarize who you think will win the November election, and why.
7.2b “Cool Beans!” Homework

The campaign in Jelly Bean Town actually began in March with the election in November. The plots below represent surveys taken during the election process in March, August, and October. Each plot shows the results of 20 different surveys.

1. In the March surveys, circle the dots on the graph where Grapey Bean and Limey Bean were tied. Based on the graph, who is ahead in the campaign in March? Explain your answer. In March, there are 4 ties between Limey and Grapey (dots which are found over the 5). There are 11 out of 20 dots below the 5, showing Grapey in the lead.

2. In the August results, circle the dots on the graph where Grapey Bean and Limey Bean were tied. Based on the graph, who is ahead in the campaign in August? Explain your answer.

3. In the October results, circle the dots on the graph where Grapey Bean and Limey Bean were tied. Based on the graph, who is ahead in the campaign in October? Explain your answer.

4. Based on the plots, is it possible that Grapey Bean could be ahead in the campaign in October? Explain. It is possible. 2/20 dots show Grapey in the lead. It just isn’t very likely that Grapey is actually in the lead.

5. Grapey Bean isn’t going to let Limey Bean win the election based on a catchy slogan! In the week before the election Grapey decides to fight back by promising “More Coolness, Less Darkness!” Grapey Bean quickly recruited several expert survey teams to sample the Jelly Bean Town population, in hopes that the new slogan will turn the tide back in Grapey’s favor.
After advertising Grapey’s new campaign slogan, the three different survey teams gathered data and plotted their results. There is one plot for each survey team.

Was Grapey Bean’s slogan successful? Will Grapey win the election now? Use the combined results from the 3 teams’ surveys to justify your answer.

Spiral Review

1. \(-1 \times -3 \times -6 = -18\)

2. Show two ways one might simplify: 2(3 + 4)

3. Convert 0.37 to a percent.

4. Art’s long jump was 7 feet shorter than Bill’s. Together they jumped 41 feet. Write and solve an equation to find how far they each jumped? \(b + (b - 7) = 41\)  
   Bill jumped 24 ft; Art jumped 17 ft

5. Examine the graph to the right showing how many hours worked versus how much money was made. Explain what the point (2, 20) means in context of the situation and the unit rate.
7.2c Class Activity: Critter Sampling (Optional Activity) Teacher Notes

Teacher notes: Scientists often want to study and make estimates about population of plants or animals in a given area. To do this they use random sampling techniques. The data from random samples are used to make conclusions about the populations.

One purpose of this activity is to use samples to draw conclusions about populations and another is to make comparisons between populations. Student groups will be drawing conclusions about their own critter population and then comparing their population to other groups.

Random sampling: Students will be doing a form of random sampling called “cluster sampling”. Students will be working in groups of 4 to study their world. The population of each world will be divided into 12 different clusters (see below) and each student will randomly select a cluster to study from their group’s world.

Each student will analyze their own sample data, pool their data within the group, and make a conclusion about their world’s population.

Prepare bags of critters (the populations) prior to class: Purchase 5 different small food items of similar size to mix together. You’ll need one small zip lock bag of the mix per group of 3-4 students (4 preferred). To prepare the critters: use a large bowl to mix the 5 different small food items in equal amounts. Foods might include: stick pretzels, fish crackers, Teddy Grahams, large sized cereal pieces, marshmallows, etc. Choose things that are fairly similar in size. Small items tend to end up on the bottom of the bowl or bag. Don’t dump everything into the mixing bowl, hold back a portion of each item to be added later.

Scoop about ¾ cup of well-mixed critters into each bag. Add an additional ¼ cup of one of the food items per bag according to the table below, that is, extra marshmallows in one bag, extra Teddy Grahams in another bag, etc. Mix in well. When distributing the bags to the students, don’t draw the attention of the students to the differences or similarities between the bags. The idea is that the students will be able to identify which populations are similar and which are different, based on their plots and their tables. Label the bags in some way so that you can remember which ones were the same. Students will be asking this later.

Prepare the Critter Worlds: Copy the Critter World sheet, one per group of students. Students will prepare the world by folding the margins up to create a fence, and taping or stapling the corners so the fence stays up.

Critter World

©2014 University of Utah Middle School Math Project in partnership with the Utah State Office of Education. Licensed under Creative Commons, cc-by.
Class Activity (Optional): Critter Sampling

Your space ship has been orbiting a new flat planet full of life. You are a member of a group of scientists who has been sent to study the flat planet. Your job as an alien biologist is to gather data about the critters, analyze the data, make plots and provide a summary about the area you will study.

The big question is: how is the critter population in your world similar or different from other worlds?

You may choose to do the alphabet activity (homework associated with this activity) in class instead of this activity.

Materials:
- Quart sized bags of critters
- Sheets of paper, rulers, pencils, tape, scissors, pieces of butcher paper to display graphs

Follow the instructor’s directions for setting up the critter worlds. The bags of mixed food items represent different populations of critters. Give your world a name.

1. Open the bag of critters and sprinkle them evenly into the world. Don’t use your hands to arrange the critters, just sprinkle them about. Spacing between critters does not have to be exactly equal. If needed, shake the world a bit or stir it with the eraser end of a pencil so that there are critters in every rectangle. Once you are done, hands off! Be careful to not shake or knock the world. (Don’t eat the critters until the activity is over!)

   Samples that are not well mixed will give results that can’t generalize to the populations. Emphasize the importance of well mixed, random samples.

2. Random Sampling: Each student in the group will randomly select a rectangle to study. To perform a random selection, each group should write the numbers 1-12 on similar sized pieces of paper and then place the numbered slips of paper into a container, mix well, and have each student draw a slip without looking. Some areas of the “world” will not be selected.

3. How should you count critters that are partway between two rectangles? Make a group decision. Student methods may vary. They may choose to count a ½ or ¼ critter so that their counts are not whole numbers, they may choose to round to the nearest whole numbers, or they might decide to count a critter as belonging in the rectangle where most of it lies.

4. Count the critters in your rectangle. Record the data in the table. Since the critters are not equal in shape or size, don’t expect equal numbers of each critter.

<table>
<thead>
<tr>
<th>Critter Description or sketch</th>

<td></td>
<td></td>
<td></td>
<td>100%</td>
</tr>
</tbody>
</table>

Total =
5. Using the table data, create a graph showing the frequencies of each of the critter types in your sample. (Think: you will be comparing your graphs to others in the group. Why might it be better to use percents rather than counts to make the graph?)
Refer to the Chapter 7 Text for examples of using bar graphs for comparing categorical data and making inferences about populations from the graphs. If comparisons are being made between unequal sized groups, percents give a better basis of comparison. However, if the samples are equal in size, then either counts or percents give comparable graphs. For categorical data such as this, either bar graphs or circle graphs are appropriate. If bar graphs are made, they should be called bar graphs, rather than “histograms” because the data is categorical. Histograms are used for graphs that display a range of numerical values, such as heights or ages. Although pictograms can be used in drawing the graph, with stacks of marshmallows or Teddy Grams, this may generate graphs that don’t truly represent the data, unless each pictogram is equal in size.

6. Scientists use data from samples in order to make conclusions about the world. Compare your graph to the graphs made by the other members of your group. Using the data from your samples, come to an agreement on an estimate for the total number of each type of critter in your world, and for the percent of each type of critter.

<table>
<thead>
<tr>
<th>World Population Estimate (count)</th>
<th>Critter 1:</th>
<th>Critter 2:</th>
<th>Critter 3:</th>
<th>Critter 4:</th>
<th>Critter 5:</th>
<th>Total critter estimate =</th>
</tr>
</thead>
<tbody>
<tr>
<td>World Population Estimate (percent)</td>
<td>Does your percent total = 100 %?</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

7. Describe the method your group used to find the estimates of the world population. Students may choose to calculate averages for their estimates. However, they might recognize that if sample sizes are different, then averaging the data gives more “weight” to the larger samples, so they might come up with a way to adjust for the different sample sizes. Once they find an estimate, they will need to scale it up to represent the population of the world, such as multiplying their estimate by 12.

8. Within your group, decide how well your samples represented the world population. Explain, using complete sentences, any problems that you might have observed with how the samples may have misrepresented the population.
9. Create a graph of the estimate for the frequencies of the critters in your world. Post this graph in the room. You can eat your critters while all the other groups are posting their graphs.

10. Every world (bag) studied today has at least one other world with a similar population. Look at all the graphs posted by the different groups. Use the graphs to see if you can find the matching sets of worlds. Verify with your instructor to see if you were right!

11. There is variability in between all the samples taken by students. What is “variability” and why did it make matching the worlds challenging? Variability means that every sample will be slightly different. Therefore, instead of finding exact matches between worlds, students have to look for the ones that are most similar.

12. Why is it important to use random sampling and not just choose a rectangle to use as your sample? Explain why this would create a problem. Random sampling helps increase the chance that the sample will be an unbiased sample from the population. If people CHOOSE the samples, they might choose based on which sample has the most critters, or which one has the most variety, or which one is in the middle. This creates a bias in the sample, which will also make the population estimate biased.
7.2c Homework: Alphabet Frequency

The two bar graphs above represent the frequency that letters occur in two languages, one graph represents the English language, the other represents the Spanish language.

1. Which 3 vowels and 3 consonants occurred most frequently in the language represented by Graph A? Write the letters in order from most frequent to least frequent.

2. Which 3 vowels and 3 consonants occurred most frequently in the language represented by Graph B? Write the letters in order from most frequent to least frequent.

3. Use the graph to estimate the frequency of the letter “a” in each language. Find the difference between the two.

4. The most frequent word in the English language is the word “the”. Based on that hint, which graph, A or B, represents the frequency of the letters of the English language? Explain your choice. Graph B. The “e” is similar in frequency, but the “t” & “h” are much more frequent in Graph B.

5. The bar graph below is a sample of the frequency of letters used in the first two paragraphs of the book “Artemis Fowl: The Lost Colony”, by Eoin Colfer, written in English. Since the graph is from a sample, the frequencies will vary a bit from the overall letter frequencies of the English language. Compare the book sample to Graphs A and B. Which graph is the book sample most similar to, A or B? Explain your choice. The frequency plot was created on the weblink “Practical Cryptography” at: http://practicalcryptography.com/cryptanalysis/text-characterisation/monogram-bigram-and-trigram-frequency-counts/
7.2c Homework Extension: Cryptograms

Cryptograms are puzzles where a symbol or letter is substituted for the actual letter. Each of the Artemis Fowl books has a cryptogram at the bottom of the pages of the book, where symbols are substituted for letters, and readers are challenged to solve the hidden message in the cryptogram.

One way people find clues in cryptograms is by looking at letter frequencies. The three most common symbols (in order) from the book “Artemis Fowl: The Lost Colony” are shown below. Which letters do they likely represent?

E, T and A

Use letter substitution to try to solve this famous quote:

YJMIR SKCN MRKCDRMU; MRXS LXIKVX YKNPU.
YJMIR SKCN YKNPU; MRXS LXIKVX JIMZKQU.
YJMIR SKCN JIMZKQU; MRXS LXIKVX RJLZMU.
YJMIR SKCN RJLZMU; MRXS LXIKVX IRJNJIXN.
YJMIR SKCN IRJNJIXN; ZM LXIKVXU SKCN PXUMZQS.

Sample Problems for Section 7.2

1. Choose the procedure that would produce a random sampling in the following situation:

   A car insurance company wants to know how many miles people drive each year.
   - Ask the teachers at your school how much they drive each year.
   - Call every 100th name in the phone book and ask how much they drive each year.
   - Ask truck drivers how much they drive each year.

b. Describe a procedure that would produce a random sampling in the following situation. Explain why your procedure will produce a random sampling.

   Your school is choosing a new mascot. The principal wants the students’ opinions.

2. Explain how your random samples in question 1 will represent the population.

3. Belle surveyed her classmates on how many donuts they eat in a month. The following table shows their responses. Make a visual representation of the data.

4. Compare the following two visual representations of how many rings some goblins are wearing. Describe the variation in the samples. Estimate the range of where the population value might lie.

5. Chloe is having a sale on rings in her store. Using the data from the charts in question 4. How many rings should Chloe sell in a set? Explain your reasoning
Section 7.3: Draw Informal Comparative Inferences about Two Populations

Section Overview: In this section students calculate measures of center and spread from data sets, and then use those measures to make comparisons between populations and conclusions about differences between the populations.

Concepts and Skills to be Mastered
1. Make comparisons of data distributions by estimating the center and spread from a visual inspection of data plots.
2. Compare two populations by calculating and comparing numerical measures of center and spread.
3. Calculate the mean absolute deviation (MAD) as a measure of spread of a population. Measure the distance between the centers of two populations of similar variability using the MAD as the unit of measure.
7.3a Class Activity: Viva la Diferencia!  (Celebrate the differences!)

Materials needed: One die

This lesson is designed to be an introduction for creating informal comparative inferences about two populations. Students will compare and contrast data gathered from a sample of male students and a sample of female students to determine the sample set which has a larger center and spread and visually identify any outliers. This lesson will rely on prior abilities in calculating measures of center and creating histograms/dot plots.

How do female and male populations compare? With a partner, choose a question below to compare female and male responses. Choose a question that you believe you will find a difference between populations.

a. How many letters are in your first, middle, and last name (total)?
b. How many states can you list in 30 seconds?
c. How many pens or pencils did you bring to class?
d. How many buttons do you have on the clothes you are wearing right now? Include your pants buttons.
e. How many words can you write in 30 seconds that start with the letter “g”?
f. How many minutes does it take you to travel to school in the morning?
g. How many pets do you have?
h. What is the length of your shoe (in centimeters)?
i. How many hours of television do you watch per week?
j. How tall are you (in centimeters)?
k. How long is your hair (in inches)?

Our Question:

___________________________________________________________________
___________________________________________________________________
___________________________________________________________________

Quietly go around the room and record the responses to your question in the table below. When a student asks you their question, you should also ask them your question. Continue until you have at least 10 female responses and 10 male responses.

<table>
<thead>
<tr>
<th>Boys</th>
<th>Girls</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

When you have finished gathering your data, go to your teacher to have the die determine how you will display it.

- If the die roll is even, construct a histogram to show male and female results.
- If the die roll is odd, construct a dot plot to show male and female results.
1. Does the male data or female data have a larger measure of spread? Explain your reasoning.

2. Find the centers of the data for males and females. Which data has the higher center, male or female?

3. Are there any data points that you would consider to be outliers?

4. What conclusions do you draw from the comparison of males and females for your question? Write three to four sentences about your conclusions.

Review your work. Prepare to present your data to the class.
Create a poster that has the following:
   1) Your question
   2) A table of your data
   3) Histograms or dot plots of the data (determined from the all-knowing die)

<table>
<thead>

</tr>
</tbody>
</table>
7.3a Homework: Review Measures of Center

REVIEW FROM 5th and 6th GRADE:

MODE: The data that occurs with the greatest frequency, or “the most”. The mode is an indicator of the shape of a distribution; it is not a measure of center.

MEAN: The mean is a measure of center. To find the mean of a set of data, add all the values together, then divide by the number of values in the data set.

The mean of 18, 6, 0, 22, 5, 19, 7 is calculated by: \[ \frac{18+6+0+22+19+7}{6} = \frac{72}{6} = 12 \]

MEDIAN: The median is a measure of center. To find the median of a set of data, arrange the data in order from least to greatest. If there is an odd number of values, the median will be the middle value. If there are an even number of values, the median will be the midpoint between the values in the middle.

Example 1: Find the median of 33, 35, 10, 19, 7, 0, 6, 7. Arrange in order: 0, 0, 6, 7, 7, 10, 19, 33, 35 There are 9 data points. The middle (median) value is the 5th one, which is 10.

Example 2: Find the median of 14, 6, 8, 42, 6, 11. Arrange in order: 6, 6, 8, 11, 14, 42 There are 6 data points. The median is the midpoint between 8 and 11, so the median = 9.5.
The midpoint between two data points can be found by finding the mean of the two points. \((8 + 11)/2 = 9.5\)

Find the mean for the following data sets:
1. 2, 6, 1, 8, 10, 2, 3, 6
   \[ \frac{38}{8} = 4.75 \]
2. 24, 14, 8, 9, 6, 5, 18, 10, 16, 22

Find the median for the following data sets:
3. 12, 8, 7, 6, 9, 5, 1, 2, 3
   \[
   \frac{6}{3}
   \]
4. 5, 1.6, 3, 8, 7, 11, 15.5, 18, 20, 11

5. A survey was conducted where respondents gave their favorite summer temperature (in degrees Fahrenheit). The results are as follows: 65, 76, 64, 78, 72, 68, 73, 72, 71, 68, 64, 85, 80, 90. Find the mean temperature from the survey. Round to the nearest degree.
20 males and 20 females were asked to approximate the number of times that they viewed Facebook each day. Histograms for the data are shown below.

6. Based on those that were surveyed, which group had a greater median, the boys or the girls? Explain your answer. Since there are 20 data points, the median is between the 10th and 11th value. The median of the male data is between 3 and 4. The median for the female data is in the 8-11 range. The females’ median is higher.

7. Why would mode not be a good measure of center for the female data distribution?

8. Create your own dot plots below that follow these rules:
   Rule #1: Dot Plot #1 must have a larger spread
   Rule #2: Dot Plot #2 must have a greater measure of center

DOT PLOT #1

DOT PLOT #2
Spiral Review

1. Simplify the following expressions.

\[-6\left(\frac{1}{5}a - \frac{1}{6}\right)\quad -\frac{6}{5}a + 1\quad \frac{1}{3}\left(-7 - \frac{1}{6}a\right)\quad -\frac{7}{3} - \frac{1}{18}a\]

2. Find each sum, difference, product, or quotient:
   a. \(-4 + -7 = -11\)
   b. \(3 - 10 = -7\)
   c. \(-9(9) = -81\)
   d. \(\frac{32}{8} = 4\)

3. Solve and graph the following inequalities:
   a. \(6x < 1 < 17\)

4. There were 850 students at Vista Heights Middle School last year. The student population is expected to increase by 20% next year. Draw a model to find what the new population will be. 1,020 students

5. Shawn surveyed his coworkers on how many times they eat out in a month. The following table shows their responses. Make a visual representation of the data.

Michael Jordan was a professional basketball player in the NBA for 15 years. He is frequently mentioned as the greatest basketball player of all time. He played for the Chicago Bulls team for most of his basketball career. He retired from the NBA in 2003.

The 1997-98 season is one of the years that the Chicago Bulls won the NBA championship. Below is a list of points scored by Chicago Bulls players, from team members who played over 40 games in the season.

1. Compare the data in the tables without doing any calculations (only using estimates). What interesting features do you see within each data set and between the two data sets? Allow students time to discuss their observations individually before discussing as a class. Students may mention: Jordan has far more points than anyone else, he has about 1300 more points than the next player on his team. He has 1000+ more points than the top player on the Raptors. The Raptors actually scored more total points. Excluding Michael Jordan, the individual Raptors players mostly outscored the Bulls when you compare them side by side, or pair them up player by player.

2. Without calculating the actual values, which team do you think has a higher points per player mean? Why do you think so? Students are likely to say the Raptors because of the higher point total. Wait for students to notice that there are more players listed for the Raptors, then ask if this will make a difference in their decision. Students might mention that even with more players, there is still a 1000 point difference in the total points, so the Raptors will still have the higher mean. Challenge the students to estimate the mean for each team before pulling out their calculators for the next question.

3. Calculate the mean and median number of points for each team. (Re-establish the importance of using the correct units of measure in all answers, in this case, “points”.)

Bulls’ mean = _______ 7429/11 ≈ 675.36 points
Raptors’ mean = _______ 8583/12 ≈ 715.25 points.
Bulls’ median = _______ 416 points
Raptors’ median = _______ 644 points

4. Is the mean or the median a more accurate measure of center for the number of points scored by the Bulls? Explain your choice. Allow students time to think about and discuss this question. The mean and median values are very different for the Bulls, by more than 200 points, so this is a very important question with regards to choosing the right measure of center for this data. When there is an outlying value far away from the rest of the values (like Jordan’s), the mean will be pulled away from the center, towards that outlying value. Because of Jordan’s scoring, only 4 of the 11 players have score totals higher than the mean, yet the median remains the middle value no matter how many points Jordan makes.

5. What would happen if you replaced Michael Jordan’s 2357 points with 10,000 points? Find the new mean and median for the Bull’s points per player. Did either value change by much? Explain.

Bulls’ Mean = _______ 1370 points
Bulls’ Median = _______ 416 points

The median stays the same but the mean nearly doubled. This illustrates why median is a good measure of center if there are outliers. It remains about the same even if there are outlying high or low values. The mean is usually not a good description of the center when there are outlying values.
7.3b Homework: The Glorious Mean and Median

1. Ms. Parrish gave her students a math test and recorded their scores. The following is data for all 16 students in her class: 84, 91, 78, 94, 79, 82, 0, 98, 75, 0, 86, 91, 98, 77, 85, 90. Find the following values:
   a. Mean ___________  Median ___________  Mode ________
   b. The two scores that are listed as zeros are from students who were absent. Re-calculate the measures of center without the zeros.
      Mean ___________  Median ___________  Mode ________
      \[ \text{Mean } 86.29 \quad \text{Median } 85.5 \quad \text{Mode } 91 \]
   c. Explain the effect that the zeros had on the mean, and which values provide the better indication of the center with respect to students’ scores.

2. Students tried out for the school play by memorizing a part. The students were rated on how well they performed and how much they were able to memorize. Their ratings were scored on a scale from 0-100. The scores for the 20 students are shown below.

<table>
<thead>
<tr>
<th>14</th>
<th>79</th>
<th>68</th>
<th>88</th>
<th>84</th>
</tr>
</thead>
<tbody>
<tr>
<td>96</td>

</tr>
<tr>
<td>100</td>
<td>98</td>
<td>88</td>
<td>74</td>
<td>88</td>
</tr>
</tbody>
</table>

   a. Sort the data from smallest to largest.

   b. Find the following values:
      Mean ________  Median ________  Mode ________

   c. The first student on the list got a sick stomach during the tryouts and couldn’t finish, so only scored a 14. The student was allowed to try again later that day, and now scores a 99.
      What is the new mean score? _____
      How much does the mean score change?

   d. Hamlet is calculating the new mean. Instead of replacing the re-do score of 99, Hamlet adds the re-do score to the end of the list, and then divides the sum by 20. What is result of Hamlet’s calculation? 87.85

   e. Explain why Hamlet’s calculation isn’t really an average. What should Hamlet do to fix the calculation? The average should be divided by the total number in the sample. Either Hamlet should have divided by 21, since there are now 21 scores, or Hamlet should have replaced the score of 14 with a 99 and divided by 20. Let the students decide which average is the best representation of the scores for the class.
3. Ten members of the Ceramics Club meet after school to make pottery. A survey was taken to see how far (in city blocks) each member of the club had to travel to get home carrying their heavy pots. The results of the survey are the following distances:
   12, 8, 14, 4, 16, 7, 4, 128, 11, 9
a. Mean ____________  Median ____________  Mode ________

b. Which would be the best measure of center for the data: mean, median, or mode? Explain your answer.

c. Remove the outlier and find the mean of the remaining nine data values.  New Mean ________

   The outlier is the student that travels 128 blocks to school. Eliminating that value gives a mean of 9.44 and a median of 9.22. (Values rounded to the nearest hundredth.)

4. Thomas and Enrique run 2 miles every week and record their times (in minutes). Their data is recorded in the table below:

<table>
<thead>
<tr>
<th>Thomas’ times</th>
<th>Enrique’s times</th>
</tr>
</thead>
<tbody>
<tr>
<td>13 14 15 16 17 18 19 20 21 22 23</td>
<td>13 14 15 16 17 18 19 20 21 22 23</td>
</tr>
</tbody>
</table>

a. Which runner has data showing the greatest spread? Explain using the plots and comparing data points.

b. Which runner has the fastest mean time? The fastest median?
   Thomas’s mean is 17 minutes (median is 16.5)  Enrique’s mean is also 17 minutes (median is 16).
   They have the same mean, but slightly different medians.

c. If you wanted to select one of these runners to represent your class in a running competition, which one would you chose, and why?
5. Caitlin recently took a tour through Mt. Timpanogos Cave. The cave is at an elevation of 6,730 feet and the temperature inside the cave stays a steady 45°F throughout the entire year. Caitlin finds it interesting that the temperature in the cave stays the same year-round. She wonders if the average annual temperature of the air outside of the cave is same or different than the average temperature inside the cave. Caitlin collected data from a nearby community at a similar elevation and found the following typical monthly temperatures for January through December.

23.6 °, 27°, 34.2°, 42°, 50.3°, 59.1°, 66.4°, 65.6°, 56.6°, 46°, 33°, 24.5°

Note: Data collected from Kamas, UT (elevation: 6475 feet, and similar latitude as Mt. Timpanogos)

a. Determine if the annual average temperature of the nearby community is the same as the temperature inside the cave. Explain your answer.

b. The Carlsbad Cave system is in the northern Chihuahuan Desert in New Mexico. Steven’s family was going on vacation to see the caves. Caitlin told Steven about how cave temperatures seem to be the same as the mean outside temperature. Steven thought he would use Caitlin’s information to find out if he would need a coat while he is inside the Carlsbad Cave system. Steven looked up the mean daily temperatures of the nearest large city, which was El Paso, Texas. Although he wasn’t able to find the averages he wanted, he found the chart below.

Use the chart of the average high and low temperatures of El Paso to find an estimate mean daily temperature of the outside air and help Steven decide if he will need a coat while he is in the caves. Although the overall average temperature isn’t available from the chart, it is reasonable to find the average temperature between the high and low for each month, use all 24 data points and find the overall average, or trace a mid-way line between the high and low values and estimate the average temperature for each month. Any of these methods will provides a fairly accurate estimate.

The calculated average is about 65°F. Steven will probably be okay without a coat.

FYI: The temperature at the deepest point in Carlsbad Caverns is a constant 68°F.

Further information about caves found at the National Park Service website: http://www.nps.gov/cave/naturescience/weather.htm

“Caves, in general, have fairly stable climate conditions. Once past the entrance area of most caves, the temperature and humidity levels become fairly stable with little variation. This is mostly due to the lack of influence from the outside environment. The temperature in these caves tends to reflect the average annual temperature for the area at that given elevation, though larger cave systems tend to capture some heat rising from the earth's core making them a little warmer than they would be otherwise.”
Spiral Review

1. What property is shown?
   a. 19 + 0 and 0 + 19 _______ identity property of addition ___
   b. 9 + 7 + 3 and 9 + 3 + 7 __commutative________________

2. Thomas flipped two quarters 80 times. He tails on both quarters 8 times. Would you expect this result? Why or why not?

3. Willy, Abby, and Maddy are playing golf. Willy ends with a score of -9. Abby’s score is -10. Maddy scores +6. What is the difference between the scores of Maddy and Abby?

4. Beth’s golf ball has a circumference of 4.71 in. What is the radius of her golf ball?

Bidziil is examining a scale drawing of the national park near his home. He wants to hike from the park entrance to a hot spring. On the map, the entrance and hot spring are 2.5 inches apart. There is a scale on the map: 1 in = 2.5 mi. How far will he have to hike?
7.3c Class Activity: Got the Point?

This section continues to review measures of center, specifically mean and median, and now brings in a measure of spread, the mean absolute deviation (MAD). Methods for calculating center and MAD are standards from the 6th grade curriculum and are being revisited in 7th grade as they compare centers and spreads of different data sets.

1. With a group of 4-5 students, record the number of pens and pencils that each of you have. Write down each of the numbers in the table provided below.

2. Find the mean of your data. What does the mean represent? Answers will vary. The mean represents the average number of pens/pencils for your group.

Mean Absolute Deviation (Review from 6th Grade): The mean absolute deviation (MAD) is a measure of variation in a set of numerical data. It is computed by adding the distances between each data value and the mean, then dividing by the number of data values.

Mean absolute deviation is contained in the 6th grade core. This lesson is meant to revisit the topic and allow students to use that skill in comparing two different populations.

3. Find the mean absolute deviation for the data you collected.

<table>
<thead>
<tr>
<th>Number of pens/pencils</th>
<th>Mean</th>
<th>number – mean</th>
</tr>
</thead>
<tbody>
<tr>
<td>All values in this column will be the same</td>
<td>All values should be positive.</td>
<td></td>
</tr>
<tr>

<td></td>
<td></td>
</tr>
<tr>
<td>TOTAL:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>AVERAGE (MAD):</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

4. In problem #3 above, you found the mean absolute deviation for your group’s data. On the number line below, mark the position of the mean. Put large bracket symbols [ ] above and below the mean at a distance of one mean absolute deviation.

5. Write down the mean and MAD for another group. Like you did above, mark the position of the mean on the number line below. Put large bracket symbols [ ] above and below the mean at a distance of one mean absolute deviation.

6. Is the MAD for your group higher or lower than the other group? What does it mean if a group has a higher MAD?
EXAMPLE for Mean Absolute Deviation (MAD):
The MAD is a measure of the spread of data. The higher the MAD, the more the data is spread out. The table below shows the 6 fastest birds in the world and their maximum recorded speeds.

<table>
<thead>
<tr>
<th>Animal</th>
<th>Maximum Recorded Speed (in mph)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Peregrine Falcon</td>
<td>242</td>
</tr>
<tr>
<td>White-throated Needletail</td>
<td>105</td>
</tr>
<tr>
<td>Eurasian Hobby</td>
<td>100</td>
</tr>
<tr>
<td>Frigatebird</td>
<td>95</td>
</tr>
<tr>
<td>Anna’s Hummingbird</td>
<td>61</td>
</tr>
<tr>
<td>Ostrich</td>
<td>60</td>
</tr>
</tbody>
</table>

To find the MAD, first find the mean (average) speed of the birds by adding all of the data and dividing the sum by the number of values.

\[
\frac{242 + 105 + 100 + 95 + 61 + 60}{6} = \frac{663}{6} = 110.5
\]

Next, find the deviation (distance) from the mean for each bird. Recall that absolute value means you’re looking for a “distance” between values and distance is always positive. Finally, calculate the average of the deviations from the mean, known as the mean absolute deviation, or MAD.

| Animal                  | | speed for each bird – mean | Deviation from the mean |
|-------------------------|-------------------------|------------------------|
| Peregrine Falcon        | 242 – 110.5             | 131.5                  |
| White-throated Needletail | 105 – 110.5            | 5.5                    |
| Eurasian Hobby          | 100 – 110.5             | 10.5                   |
| Frigatebird             | 95 – 110.5              | 15.5                   |
| Anna’s Hummingbird      | 61 – 110.5              | 49.5                   |
| Ostrich                 | 60 – 110.5              | 50.5                   |

Mean Absolute Deviation = $\frac{131.5 + 5.5 + 10.5 + 15.5 + 49.5 + 50.5}{6} = 43.83$

What does the MAD indicate? For this data, the MAD shows that average difference between each bird’s speed and the mean is 43.83 mph.

Notice that the Peregrine Falcon’s speed is the farthest from the mean. If you use the MAD as a unit of measure, anything that is 3 MAD from the mean is very unusual. The Peregrine Falcon is three MAD’s from the mean. $(3 \cdot \text{MAD}) = (3 \cdot 43.83) = 131.5$. The Peregrine Falcon is unusually fast, even compared to the other 5 fastest birds in the world!
1. Students in 7th and 9th grade were asked the number of hours they slept on non-school nights. Data from 20 students in each grade were randomly selected and the histograms for the data are shown below.

1. Find the median of the sleep data for both the 7th grade students and the 9th grade students. There are 20 students, so the median can be found by looking at the value between the 10th and 11th student.
   
   7th grade median: _____________  
   9th grade median: _____________

2. Without computing, would sleep data for the 7th grade students or the 9th grade students have a larger MAD? Explain your answer. 9th grade has a larger variation, so it would have a larger MAD.

3. Compare the two graphs. Using the graphs and your calculations, write a few sentences about the conclusions that can be made about the amount of sleep that these twenty 7th grade students get compared to the twenty 9th grade students.

4. One statistic used in baseball is how many bases that players steal. This table shows the number of bases stolen by Ken Griffey Jr. and Rickey Henderson each year from 1990 – 2000.

   Ken Griffey, Jr. aka “The Kid”

c. Calculate the mean absolute deviation (MAD) for the class. Round to the nearest centimeter.

4. The MAD for the heights of the basketball players is 8 cm. Use measure of center, spread and MAD to compare and contrast your class’s height to that of the NBA team. Discuss your findings below:
7.3d Homework: NBA Heights

Someone who is more than 3 MAD’s shorter (or taller) than the mean height is considered unusual. Use the basketball player height data to answer the following questions about some unusual basketball players.

1. Mark the mean height for the basketball players on the number line (you calculated the mean in the class activity, #2). Measure 1 MAD (8 cm) above and below the mean, and mark each with a “1”. Then measure 2 MAD above and below the mean and mark that distance with a “2”. Repeat for 3 MAD above and below the mean.

   Mean at 202, 1 MAD from the mean at 194 & 210. 2 MADs from the mean at 186 and 218, 3 MADs from the mean at 178 and 226

![Number Line with Mean and MADs](image)

2. Tyrone “Muggsy” Bogues was a professional basketball player from 1987-2001. He was only 5 ft. 3 in tall, which is 160 centimeters. Place a mark on the number line for Muggsy’s height, and estimate how many MAD’s his height is from the mean.

3. Yao Ming played professional basketball from 2002-2010. He was 7 ft 6 in tall, which is 229 cm. Place a mark on the number line for Yao Ming’s height, and estimate how many MAD’s his height is from the mean.

4. Whose height was more unusual, compared to the basketball players in this data set, Muggsy’s or Yao Ming’s?
Spiral Review

1. Find the following quotients:
   a. \[
   \frac{3}{7} \div \frac{1}{4}
   \]
   b. \[
   \frac{1.7}{0.1}
   \]
   c. \[
   \frac{93}{5}
   \]

2. Choose the procedure that would produce a random sampling in the following situation:

   In compiling a brochure about Mathville, the city council wants to know how long people have lived in the city.
   
   - Ask everyone in one neighborhood how long he or she has lived there.
   - Call every 10th name in the phone book and ask how long he or she has lived there.
   - Ask students at the university how long he or she has lived there.

3. Amie is making cookies for a math party. She has a triangular cookie cutter that is 3 in. on the base and 3.5 in. tall. She rolls her cookie dough into a square with a length of 15 in. About how many cookies will Amie be able to make?

4. Wayne buys a new tie. The tie is 20% off and then he has a coupon for an additional $2 off. If Wayne pays $46, how much was the tie originally?

5. The following list is the names of students in Ms. Jones’ kindergarten class. Find the mean, median, and mode for the lengths of their names.
   
   a. Mean: _____
   b. Median: _____
   c. Mode: _____
   
   | Jillian | Justina | Chris | Jodi | Casey |
   | Carl    | Nick    | Bart  | Diego| Doug  |
   | Amber   | Pat     | Kristie | Kaylee | Louise |
7.3e Class Activity: MAD about M&M’s

Below is data collected for the number of M&Ms in 30 small and 30 large bags of M&Ms. As you can see a small bag contains 1.69 oz. while a large bag contains 3.14, however the actual number of candies varies. The mean and MAD for both small and large bags are also provided. On the next page you will display these data.

In the space below, create a dot plot for the number of M&M’s in the small bags of M&M’s and create a dot plot for the number of M&M’s in the large bags of M&M’s.

Number of M&M in the small bag.

Number of M&M in the large bag.
1. How does the spread for the number of M&M’s in a small bag compare to the number of M&M’s in a large bag? Explain your answer.

Students may compare the spread based on the dot plots or by comparing their MAD’s. Visually students will identify that the 2 sets of data have approximately equal variability and the values for the MAD would confirm that claim. As a class, ask the students what they would think would be a reasonable MAD value. Would a mean absolute deviation of 5 M&M’s seem reasonable? 10 M&M’s? 1 M&M?

2. On your dot plot below, circle the mean for each data set. What is the difference between the mean for a small bag of M&M’s and the mean for a large bag of M&M’s?

(see number lines below) 103 – 54 = 49 M&M’s; almost an entire small bag of M&Ms
103 and 54 should be identified on the number line.

What is the difference between the centers as a multiple of the MAD value?

3. The mean absolute deviation for both data sets is approximately 1.5 M&M’s. Approximate the number of MAD’s between 54 and 103.

Have each student reason through the question rather than use a calculator. Have them write down their guess.

Possible student estimation strategies: Students could use the number line in #2 to count the number of MAD’s (1.5 units) between 54 and 103. Students may find it easier to mark off every 3 units and then double that number for their answer (see number line below). Other students may use other methods of reasoning to come up with an estimate. Approximations should be around 32 MAD’s. (32 \( \frac{2}{3} \))
Estimate the following:
1. $35/4 \approx 9$
2. $14/3 \approx 5$
3. $35/6 \approx 6$
4. $63/5 \approx 13$
5. $120/8 \approx 15$
6. $1850 / 15 \approx 123$
7. $7/0.5 \approx 14$
8. $654 / 4 \approx 164$
9. $18 / 2.5 \approx 7$
10. $12/1.5 \approx 8$

4. Calculate the number of MAD’s between 54 and 103 by dividing the distance between the means by the MAD.

Distance between the means = \( \frac{103 - 54}{\text{MAD}} \)

Explain to the students that the mean of the large bag of M&M’s is about 33 MAD’s larger than the mean of the small bag.

5. Suppose that a 2.17 oz. bag of Skittles has a MAD of approximately 1.5. There are an average number of 57 Skittles in a bag.
   a. Measure the distance between the means of the 2.17 oz bag of Skittles and the 1.69 oz. bag of M&M’s.

\[
57 - 54 = 3 \text{ pieces of candy}
\]

b. Rewrite your answer in part (a) using MAD as the unit of measure.

\[
\frac{3}{1.5} = 2 \text{ MAD}
\]

6. Suppose that a 14 oz. bag of Skittles also had a MAD of approximately 1.5 with a mean of 360 Skittles.
   a. Measure the distance between the means of the 14 oz. bag of Skittles and the 1.69 oz. bag of M&M’s.

\[
240 - 57 = 183 \text{ pieces of candy}
\]

b. Rewrite your answer in part (a) using MAD as the unit of measure.

\[
\frac{183}{1.5} = 122 \text{ MAD}
\]
7.3e Homework: MAD About Precipitation

1. Utah has an average precipitation of 12.2 inches per year, with an MAD estimated of 4.5 inches. Utah is ranked 49th for precipitation out of all the states. (Nevada is 50th.) Precipitation includes both rain and snow.
   a. What does mean absolute deviation (MAD) measure, in terms of precipitation in Utah? The MAD is a measure of how spread out the precipitation amounts are for different locations within the state of Utah. The average absolute distance from the mean is about 4.5 inches of precipitation.

   b. One of the driest cities in Utah is Wendover, getting only 4.1 inches of precipitation per year. How many MAD away from the mean is the precipitation amount for Wendover? 12.2 – 4.1 = 8.1 inches of precipitation. 8.1 inches / 4.5 inches = 1.8 MAD Remind the students that units of measure are a very important part of the answer.

   c. One of the wettest places in Utah is Alta Ski Resort, getting about 54 inches of precipitation per year. How many MAD away from the mean is the precipitation amount for Alta?

2. The state of Hawaii has an average precipitation of 63.7 inches per year, with an MAD estimated of 14 inches. Hawaii is ranked in 1st place for precipitation out of all the states.
   a. One of the driest places in the state of Hawaii is Makena Beach, on the island of Maui. It gets about 17 inches of precipitation per year. How many MAD away from the mean is the precipitation amount for Makena Beach?

   b. One of the wettest places in Hawaii is Hilo, on the island of Hawaii. It gets about 127 inches of rain per year. How many MAD away from the mean is the precipitation amount for Hilo?

3. How much larger is the MAD for precipitation in the state of Hawaii than the MAD for precipitation in Utah? About 3.4 times as large. Estimates are appropriate, so an appropriate answer could also be: between 3 and 4 times as large.

4. Recall that the MAD for precipitation in Utah is estimated at 4.5 inches, and for the state of Hawaii it is estimated at 14 inches. What does that tell you about the range of precipitation values for Utah compared to the range for the state of Hawaii? The range of values for precipitation in Utah is a lot less than for the state of Hawaii, or in other words, the precipitation in Utah is more similar throughout the state than for Hawaii. FYI: the windward sides of the Hawaiian Islands are usually semi-deserts, while the leeward sides are tropical forests.
Spiral Review

1. While living in Mexico City as a foreign exchange student, Ricky kept track of the temperature at noon every day in February. Find the mean, median, and mode temperature in February.

   Mean: _____

   Median: _____

   Mode: _____

2. Every morning, Myles picks a random shirt and random pants from his closet. If he has blue, red, brown, and orange shirts and jeans or khakis for pants, what is the probability the Myles will be wearing a brown shirt and jeans?

3. Find the value of $x$ in the diagram to the right:

4. Eden is planting a garden. Her garden plot is $14\frac{1}{2}$ feet long. Strawberry plants should be planted about $1\frac{1}{2}$ feet apart. How many strawberry plants can she fit in one row if she has a $\frac{1}{2}$ foot empty space on each side?

5. Ines is standing on a dock 3 feet above the surface of the lake. She dives down 10 feet below the dock. Then she comes up 7 feet. Where is she now? Write a number sentence showing her movement.
7.3e MAD Olympic Games!

Teacher Notes:
This lesson is intended to demonstrate that computing MAD values of two data sets allows for the comparison of a single data value in each set to one another.

For example, suppose that the average amount of ice-cream an American eats per year is 48 pints with a MAD value of 6 pints and the average number of hot dogs eaten per year is 70 with a MAD of 8 hot dogs. Patrick ate 63 pints of ice-cream this year and Monique ate 86 hot dogs this year. Who was more unusual in the amount they ate compared to the mean? The amount of ice-cream that Patrick ate that year is 2.5 MAD’s away from the mean. \( \frac{63 - 48}{6} = 2.5 \) The amount of hot dogs that Monique ate that year is 2 MAD’s away from the mean. \( \frac{86 - 70}{8} = 2 \). The conclusion is that Patrick’s ice-cream eating is more unusual than Monique’s hot dog eating compared to their respective averages.

This activity is intended to be a 2-day activity. The first day, the students will be competing in two “Olympic Games”, Penny Races and Blind Balance. They will be paired up with another student so that while one is competing, the other is measuring and recording the data.

Instructions for Penny Races:
Supplies needed: Pennies and one timer per student pair (student might use their phones)
Students will be rolling a penny across a tile floor and measuring the distance traveled. The hallway would be a great place for the students to roll their pennies. For ease, have students measure the distance in terms of the number of complete tiles that it was able to travel. No partial tiles allowed. Agree as a class on rounding down to the nearest tile: for example, if the penny goes 10.7 tiles, then the students should record 10 tiles. If you do not have access to a tile floor, you might use the gym. Use masking tape and put a tape mark down for every one foot increment. Label each tape mark based on the foot marking, for example at 4 feet from the starting line, put a piece of tape on the floor that is labeled “4.”

Instructions for Blind Balance:
Supplies needed: Timers (again students might use their phone)
Students will be standing crane style: eyes closed, standing on one foot with leg bent in front of body, and arms outstretched. Students will measure the time they are able to maintain the position without dropping their leg, tipping over, or opening their eyes. Students will be in pairs. One students will balance while the other uses the timer and then switch roles and repeat.

Possible Alternate Activities:
If these activities are not feasible, here are some other options:
- Q-tip Javelin Throw – Students toss a Q-tip to see how far it travels. This is similar to the penny races. You may choose to measure distance by the number of tiles or using a tape measure.
- Tongue Tied – Give the students a passage to have the students read, such as the Gettysburg address. Students will record the time it takes them to coherently read through the entire passage. If they cannot be understood, they must restart the passage.
- Paper Clip Puzzle – Each student pair is given 5 paper clips. The students will measure the time it takes to string 5 paper clips together and then take them apart again.

Note that students might feel uncomfortable if they have unusually large or small values. Make note to the students that being an outlier is awesome! It makes the data interesting!

Important!: This is the first day of the 2-day activity. At the end of the first day, collect the student’s data. Prior to the next class, compute the mean and MAD for each.

Online Calculator to compute Mean and Mean Absolute Deviation:
http://www.alcula.com/calculators/statistics/mean/

Disclaimer: This activity assumes that the data collected is symmetrical and approximately normal in order to use the mean as a measure of center and mean absolute deviation as a measure of the spread.
7.3f Classwork: MAD Olympic Games!

Instructions: As a class, you will be competing in two MAD Olympic events: Penny Races and Blind Balance. You will be working with a partner as you compete.

Penny Races: With your partner, decide who will be competing first. The goal for this event is to roll a penny as far as you can across the floor.
- Roll the penny across the tile floor.
- Count the number of full tiles the penny traveled from the starting line. Partial tiles don’t count!
- Record the data in the table at the bottom of the page by the star for the first student and by the diamond for the second student...

Blind Balance: The partner who went second in Penny Races gets to go first in Blind Balance. The goal for this event is to see how long you can stand in the crane position: standing on one leg, with your arms outstretched, and your eyes closed. One partner will other records time using a timer. Timing ends when your foot touches the ground, you tip over, or if you open your eyes.
- Student #2: Stand on one foot, with your arms outstretched, and your eyes closed
- Student #1: Use a timer to measure how long your partner can stay in the crane position. Record their time in the bottom of the page by the heart . Round to the nearest second.

Switch roles and repeat. Record Student #1’s time by the smiley face. 😊

Once you have finished recording the data, tear out and turn in. Only turn in one for both you and your partner.

<table>
<thead>

MAD Olympic Games: Day II

Gold Medals in the MAD Olympic Games:

Write down the top records in the two event:

   Penny Races: ________ tiles
   Blind Balance: ________ seconds

“Best of the Best” Title Winner:
1. The MAD Olympic Officials want to give a “Best of the Best” Title. Which winner do you think did the best compared to the rest of the class, the Penny Races winner or the Blind Balance winner?

2. MAD Olympic Officials insist that the “Best of the Best” Title must be given to the player that performed the best in their event compared to the other competitors. The officials have included the mean and mean absolute deviations for each event. Record these values below:

<table>
<thead>
<tr>
<th>PENNY RACES</th>
<th>BLIND BALANCE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mean:</td>
<td>Mean:</td>
</tr>
<tr>
<td>MAD:</td>
<td>MAD:</td>
</tr>
</tbody>
</table>

Note: Discuss with the students that in order to use the mean as a measure of center and the mean absolute deviation as a measure of spread, the data collected must be approximately normal. For the sake of this activity, have the students assume that the data is approximately normal (which it may or may not be).

3. Ms. Needa Winna suggested that the winner of the title should be the person that has the record that is the farthest from the mean in that event.

   A) Calculate the absolute difference between the Penny Races record and the class mean for the Penny Races Event
   
   \[|\text{Penny Races Record} - \text{Mean}| = \]

   B) Calculate the absolute difference between the Blind Balance record and the class mean for the Blind Balance Event.
   
   \[|\text{Blind Balance Record} - \text{Mean}| = \]

Solutions will vary depending on class data. Make sure that the students use correct units when they write their answers. In (A) the units will be in tiles and in (B) the units will be in seconds.

   C) Is this a good method in determining a winner? Why or why not?

This is not a good method. The events have different units of measure, so it is not possible to make a comparison. How would the absolute difference for the Penny Races event be different if it was measured in inches? The following questions will lead the students to convert the absolute differences into MAD units and therefore will allow for comparison.
4. Mr. Hooda Champ suggests that the winner should be whichever event winner has the record that is the greatest number of MAD units away from the mean.

    A) Calculate the number of MAD units away the Penny Race record is from the mean by diving the absolute deviation (#3A) by the Penny Races MAD.

    B) Calculate the number of MAD units away the Blind Balance record is from the mean by diving the absolute deviation (#3A) by the Blind Balance MAD.

    C) Is this a good method in determining a winner? Why or why not?
    This is a proper method in determining who is better at their particular event compared to the class. Both records have been converted to MAD units and can therefore be compared. The player that is the largest number of MAD units away from the mean is the most different from the class and is more of an outlier than the other.

5. Who should receive the “Best of the Best” Title? Explain your answer.
    Answers will vary depending on the class data. The student who would be given the “Best of the Best” title is the one whose record is the largest number of MAD units away from the mean.
7.3f Homework : MAD Olympic Games

1. Martin participated in a hot dog eating contest. He ate 30 hot dogs in 10 minutes. The average number of hot dogs eaten by the contestants was 12 hot dogs with a MAD of 6 hot dogs.
   
   a. Martin ate _____ more hot dogs than the average contestant.
   b. Find the number of MAD units Martin was from the mean.
      \[ \frac{18}{6} = 3 \]

2. According to Pew Internet (2012), teenagers send an average of 60 texts per day. Suppose that the mean absolute deviation is 15 texts. Lily sends about 35 texts per day.
   
   a. Lily sends ______ fewer texts per day than the average teenager.
   b. Find the number of MAD units Lily is from the mean.

Anya recently got an 85% on her Geography test and a 90% on her Spanish test. She knows that she got a higher grade on her Spanish test, but wonders which test she did better on compared to the class.

3. How many MAD units away was her Geography test score from the class average? The Geography test had a mean of 70% with a MAD of 5%.
   \[ |85\% - 70\%| = 15\% \]
   \[ 15\% / 5\% = 3 \]
   Anya scored 15% higher than the class.
   Anya’s score is 3 MAD units away from the mean.

4. How many MAD units away was her Spanish test score from the class average? The Spanish test had a mean of 80% with a MAD of 5%.

5. Which test did Anya do better on compared to the rest of the class?

Who’s more unique??

<table>
<thead>
<tr>
<th>Joyti Amge – Height: 25 inches</th>
<th>Sultan Kösen – Hand Span: 28 cm</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mean Height: 65 inches</td>
<td>Mean Hand Span: 21 cm</td>
</tr>
<tr>
<td>MAD: 3.5 inches</td>
<td>MAD: 2.2 cm</td>
</tr>
</tbody>
</table>

6. Use the data in the table to determine who is more unique, Joyti Amge, the shortest woman in the world, or Sultan Kösen, the man with the largest hand span in the world?
Spiral Review

1. Find the missing information about the following circle:
   
   Diameter: ______
   
   Circumference: 15.7 cm
   
   Area: ______

2. Write and solve an inequality for the following problem: The five times the sum of a number and 11 is at most 175.
   
   \[5(x + 11) \leq 175\]
   
   \[x \leq 24\]

3. Represent the sample space for each of the following events. If possible, use various methods for representing the same space.
   
   a. Sum from rolling a four-side die twice
   
   b. Flipping a quarter twice
   
   c. Choosing an ice cream sundae from vanilla, chocolate or strawberry ice cream and sprinkles, hot fudge, whip cream or caramel topping

4. Write and solve an equation for the following problem: Emanuela is arranging her living room. The living room is 10.4 feet wide. Her couch is 7 feet long. How much space should be on each side of the couch for it to be centered along the wall?

5. The following table shows the amount of dry cereal and water to make hot wheat cereal. Is the relationship of cereal to water proportional? Why or why not?

<table>
<thead>
<tr>
<th>Dry Cereal</th>
<th>Water</th>
</tr>
</thead>
<tbody>
<tr>
<td>(\frac{3}{16}) c</td>
<td>1 c</td>

Chapter 8: Geometry Part 2: Measurement in 2- and 3-Dimensions, Plane Sections of Solids (2 weeks)

UTAH CORE Standard(s)

Draw, construct, and describe geometrical figures and describe the relationships between them.
1. Describe the two-dimensional figures that result from slicing three-dimensional figures, as in plane sections of right rectangular prisms and right rectangular pyramids. 7.G.3

Solve real-life and mathematical problems involving angle measure, area, surface area, and volume.
2. Know the formulas for the area and circumference of a circle and use them to solve problems. 7.G.4
3. Solve real-world and mathematical problems involving area, volume and surface area of two- and three-dimensional objects composed of triangles, quadrilaterals, polygons, cubes, and right prisms. 7.G.6

Chapter Summary:

Throughout this chapter students develop and explore ideas in geometry around measures in one-, two-, and three-dimensions. Additionally, students will tie concepts learned previously in 6th and 7th grade to content in this chapter. Section 1 begins with a brief review and practice with perimeter and area of polygonal figures. Students then use their knowledge of area and perimeter to solve real-world problems, find the area of non-standard shapes and review ideas around percent increase/decrease and scale factor, and connect their understanding of one- and two-dimensional measures to adding and multiplying algebraic expressions by finding the perimeter and area of figures with variable expression side lengths.

Section 2 starts with students exploring plane sections of 3-D solids. Exercises in this section are designed to help students develop an intuitive understanding of dimension (building up and cutting down). Students will notice that plane sections of 3-D objects are affected by: a) the type of solid with which one starts, e.g. right prism versus a pyramid and b) the angle of the cut to the base and/or other faces. This observation should help students understand when and why parallel (and/or perpendicular) cuts to a specific face are needed to create uniform cross sections, and then by extension, uniform cubed units for finding volume. In other words, the study of plane sections here is to help students develop an understanding of the structure of a solid and procedures for finding volumes. Throughout the exercises, students should develop a stronger understanding of units of measure for one-, two-, and three-dimensions. Towards the end of this section students review the use of nets (a concept from 6th grade) to find surface area of prisms and cylinders and then to differentiate this measure from volume, which they will also find.

VOCABULARY: area, axis of symmetry, circle, circumference, cross-section, cube, cylinder, edges, equidistant, face, plane section, perimeter, polygon, polyhedron, prism, pyramid, quadrilateral, rectangle, square, surface area, symmetry, trapezoid, triangle, volume, vertices.
CONNECTIONS TO CONTENT:

Prior Knowledge: In 6th grade students found areas of special quadrilaterals and triangles. They also found areas of other objects by decomposing them into rectangles and triangles. In Chapter 5 of this text, students extended that understanding to finding the area of a circle. Also in 6th grade, students found volume of rectangular prisms and their surface areas by using nets. During their study of geometry in 6th grade, students should have learned that the height and base of an object are always perpendicular to each other. They will build on this understanding as they apply their knowledge of area and volume to real life contexts and as they explore cross sections and plane sections.

Future Knowledge: In 8th grade, students will continue working with volume, formalizing algorithms for volume of cylinders and adding methods for finding the volume of cones and spheres. Students explore cross sections of objects in 7th grade to understand how dimensions are related to each other and the algorithms for surface area and volume. Further, ideas developed through cross section activities are foundational in the study of calculus. Lastly, ideas about planar sections will be extended in secondary mathematics when students explore Cavalieri’s Principle.

</tr>
<tr>
<td>![Bar Graph]</td>
<td>Attend to Precision.</td>
<td>Careful attention should be paid to explanations and units throughout this chapter. Students will be expected to attend to several ideas at the same time. Students should attend to precision as they explain ideas throughout this chapter. For example, when discussing cross sections, students should use precise language in describing the angle of cuts to the base, faces and/or edges.</td>
</tr>
</tbody>
</table>
| ![Grid] | Look for and make use of structure.                                   | Students will connect ideas of one-, two-, and three-dimensional measures to simplifying numeric and algebraic expressions, including this example from the 8.2d Homework: Determine which expression(s) will give the surface area or volume for a 3-D object. | a. $2(6+2+3)$  
  b. $3\times2\times6$  
  c. $(2\times6+2\times3+3\times6)2$  
  d. $2\times3\times2+2\times3\times6+2\times6$ |
| Use appropriate tools strategically. | Students will use a variety of tools in this chapter including play dough, rulers, graph paper, and calculators. Encourage students to make sense of ideas with tools. |
| Look for and express regularity in repeated reasoning. | Students will note in this chapter that length is one-dimensional, area is two-dimensional and requires 2 length (2 one-dimensional measures) that are perpendicular, and volume is three dimensional and requires 3 lengths that are each perpendicular to each other. |
8.0 Anchor Problem; Designing a Swimming Pool:

The city is looking to build a new swimming pool at the city park. In their city council meeting, they determined that they want the pool to hold no more than 2500 m³ of water in order to conserve water.

A. Help the city council to choose a design for the swimming pool. Design three different swimming pools that each hold at least 2000 m³ but no more than 2500 m³ of water.

B. Choose your favorite of the three designs from part A. Find new measures for the pool so that: a) it holds twice as much water as your original design and b) it remains the same overall shape (but not size) as the original.
Section 8.1: Measurement in Two Dimensions

Section Overview:

This section involves a review and extension of previously learned skills (from 6th grade) involving perimeter and area of plane figures and volumes of right solids. The section begins with a review of perimeter and area and then moves to finding area of irregular figures, first with numeric side lengths and then with variable expression side length. Additionally, students continue work on skills developed earlier in the year including percent increase/decrease, scale factor for perimeter and area, and simplifying algebraic expressions. The end of the section focuses on all these skill in various real-world and mathematical contexts.

Concepts and Skills to be Mastered (from standards)

1. Know the formula for the area and circumference of a circle and use them to solve problems.
2. Give an informal derivation of the relationship between area and circumference of a circle.
3. Solve real-world and mathematical problems involving area, volume, and surface area of two- and three-dimensional objects composed of triangles, quadrilaterals, polygons, cubes, and right prisms.
8.1a Class Activity: Differentiate Area and Perimeter

REVIEW:

1. Rectangle Riddle #1: Can you figure out the dimensions for each rectangle? Use the clues below to draw the four different rectangles described.
   - Rectangle A has a perimeter equal to that of Rectangle B.
   - Rectangle A is a square.
   - Rectangle B has an area of 24 square units. It is as close to a square as possible for that area if the side lengths are whole numbers.
   - Rectangle C has a perimeter equal to the measure of the area of Rectangle B. Rectangles C’s length is 3 times the width.
   - Rectangle D has two different odd integers as length and width; each is 1 unit greater than the length and width of Rectangle B.

Several ideas should be discussed as student engage in the “riddles”:
- Quadrilaterals can be defined by sides, angles or a combination.
- Relationship between perimeter and area:
  - Two rectangles with the same perimeter can have different areas.
  - Discuss similarities and differences in how each is found (“counting” linear units vs. counting square units).
- What happens when side lengths are not whole units? Connect ideas here to fraction arithmetic.
Use words and models to explain the difference between perimeter and area. Answers may vary. Perimeter is a one-dimensional (length) unit of measure and area is a two-dimensional (square) unit of measure. Stress to students that for area, length and width are perpendicular to each other.

2. Rectangle Riddle #2: Can you figure out the dimensions for each rectangle? Use the clues below to draw the four different rectangles described.

- The numeric measure of the area of Rectangle #1 is twice the number representing the perimeter. Rectangle #1 is 8 units wide.
- Rectangle #2 has the same number representing the area and the perimeter; the perimeter is 1/2 the perimeter of Rectangle #1.
- Rectangle #3 has the same length as Rectangle #1. The area of Rectangle #3 is equal to the difference between the areas of Rectangles #1 and #2.
- Rectangle #4 has an area 6 square units less than the area of Rectangle #3 and a width 2 units more than the width of Rectangle #2.

3. What helped you most to accomplish “Rectangle Riddle #2”? 

©2014 University of Utah Middle School Math Project in partnership with the Utah State Office of Education. Licensed under Creative Commons, cc-by.
For questions #4-6 use a piece of graph paper to answer each:

4. List as many rectangles as you can that have an area of 36?
   Answers will vary, but the product of the length and width need to result in 36 square units:
   Students will likely quickly note: 1 unit by 36 units, 2 units by 18 units, 3 units by 12 units, 4 units by 9 units, 6 units by 6 units.
   Encourage them to find dimensions that are not whole units: (1/2) unit by 72 units, 1.5 units by 24 units, 2.25 units by 16, etc. This is a good opportunity to review fraction arithmetic. You may also choose to connect ideas here to solving equations, e.g. \((5/3)x = 36\), find \(x\).

5. DRAW two different parallelograms that have the same area. State their base and height.
   Answers will vary, but must satisfy the statement above. For each pair, the base and height must be the same.

6. DRAW two different triangles that have an area of 12. State their base and height.
   Answers will vary. All answers will satisfy the equation \(0.5(b)(h) = 12\). Again, encourage students to find non-whole number lengths for the base and/or height. See #5 for extension ideas.

7. Suppose you start with a rectangle that has a base length of 6 and height of 4. If you triple the length of the base, what do you have to do to the height to have a new rectangle of the same area?
   Divide the height by 3. Explore this idea with students on a grid as well as arithmetically.
Activity:

Mike, Juliana and Joe were working together on a garden area and perimeter problem their teacher gave them. The problem is to make the area of a garden larger without having to buy more fencing (increasing the perimeter.) Their task is to figure out if that’s possible.

Mike said, “We have to buy more fencing because if we increase the area of the garden we will need more fencing to go around.”

Mike’s statement is not true. For example, a fence of length 100 feet can enclose a garden that is 1 foot by 49 feet; the area would then be only 49 feet squared. However, the same amount of fencing could be altered to contain a 10 foot by 40 foot garden; now the area is 400 feet squared. Same perimeter, different area.

Juliana had a different opinion. “That’s not true,” she said, “We can use the same amount of fencing and move it to make the area of the garden larger.”

See above; this statement is entirely true.

Joe disagreed with both Mike and Juliana. He said, “I know a way that we can make the garden larger and use less fencing.

There is truth in this statement. For example if they had 100 feet of fencing and their original garden was 1 foot by 49 feet the garden would have an area of 49 sq. ft., then using 90 feet of fencing to enclose a 5 foot by 40 foot garden would result in an area of 200 sq. ft. which is larger than the original 49 square foot area. The maximum area 100 feet of fencing might enclose is 625 square feet (a 25 foot by 25 foot garden) IF we limit the shape of the garden to a rectangle. We can get even more area from regular polygons with more sides and the most with a circular garden.

Who is right?

Note: students will have to choose length of fencing with which to experiment.

A. Group response: Use graph paper and string to help you think about the problem.
   a. Decide who you think is right (Mike, Juliana or Joe.)
   b. Come up with a possible answer with your group.
   c. Prepare your group explanation and presentation.
   d. Be certain to justify your conclusion with reasoning and calculation.

B. Challenge: Examine the Garden Problem using a spreadsheet. Consider all possible rectangles with perimeters of 36 units. How does the area change as you change the configuration of the perimeter?

   Suggest that students:
   a. Name the variables in the columns (perimeter, width, length, area).
   b. Look for a pattern when they fill in their spreadsheet.
   c. Create graphs (charts) to get a visual picture of what’s happening to area as width and length vary.
   d. Ask them: What do you know about the garden problem from looking at the table and the graphs?
8.1a Homework: Perimeter and Area Problem Solving

Answer each of the questions below.

1. What is the least number of tiles you can add to the figure below to create a shape with a perimeter of 16? Note: When adding a tile, the new tile must share at least one side with the original shape; each tile is 1 unit by 1 unit.

2. Use the original figure given above to answer a-d. Draw your answers. Note, an answer of just “yes” or “no” is not sufficient. Use pictures or words to justify your answer.

   a. Can you add a tile to this figure to increase the perimeter by 1? If so, how?
   
   b. Can you add a tile to this figure to increase the perimeter by 2? If so, how?
   
   c. Can you add a tile to this figure to increase the perimeter by 3? If so, how?
      No, this is not possible. Explain in your own words why this is not possible.
   
   d. Can you add a tile to this figure so that the perimeter doesn’t change? If so, how?

3. Can you make more than one shape with the same perimeter, but different areas? Show your ideas with grid paper.

4. Can you make more than one shape with the same area, but different perimeters? Show your ideas with grid paper.

5. If you pick any whole number between 12 and 24, use that many unit tiles, can you make a shape where the area and perimeter are equal? Show your ideas.
1. Find the area of each of the following shapes:

   a. [Diagram of a triangle with sides 5 ft, 6.4 ft, and 5.1 ft]
   b. [Diagram of a rectangle with sides 6 ft and 4 ft]
   c. [Diagram of a circle with radius 2.4 ft]
   d. [Diagram of a trapezoid with bases 2 ft and 2.24 ft, and height 4 ft]

2. Solve: $-8 < -3m + 10 \quad m < 6$

3. Solve: $-12 > 3x \quad x < -4$

4. A website says that the odds of Mr. and Mrs. Durrand having a baby with blue or hazel eyes is 50:50. Describe a simulation that models the color of eyes their baby will have.
   
   Answers may vary. Possible simulations include tossing a coin or rolling a fair die (assigning 1-3 to one color 4-6 to the other; or odds to one color even to the other color).

5. Write $\frac{3}{5}$ as a percent and decimal. 60% 0.6
8.1b Class Activity: Areas of Irregular Shapes

The following shapes have been drawn on square dot paper. The distance between each dot represents one unit. Use what you have learned about area to find the area of each shape (A-L).

A: A = 14 sq. units
B: A = 18 sq. units
C: A = 13.14 sq. units
D: A = 12 sq. units
E: A = 3 sq. units
F: A = 12 sq. units
G: A = 16 sq. units
H: A = 26.28 sq. units
I: A = 8 sq. units
J: A = 11 sq. units
K: A = 4.5 sq. units
L: A = 5 sq. units

You might want to review with students that they can “count” squares, “cut” an object into smaller parts and then add all the parts together, or find the area of a larger shape and then subtract parts to get to the desired shape.

Use your knowledge of area and the problems that you completed above to find the area of the following irregular shapes.

M A = 48.91 sq. ft
N A = 2400 sq. cm
O A = 1135.89 sq. m
1 a. Johona is building a deck off the back of her house. To the right is a sketch of it. She will need to have a full concrete foundation below the deck. Find the surface area of the concrete foundation.

\[ A = 102 \text{ sq. ft} \]

b. Suppose Johona wants to build her deck onto a concrete foundation that is 1.5 ft. thick and has the same surface area as the deck. How many cubic feet of concrete will she need?

\[ V = 102 \times 1.5 = 153 \text{ ft}^3 \]

c. How many cubic yards will she need?

\[ \frac{153}{27} = 5 \frac{2}{3} \text{ yd}^3 \]

To help students understand why they need to divide by 27, you might create a \(3\times3\times3\) cube with unit blocks and help students connect the fact that 3 ft = 1 yard to this situation.

2. a. Hugo is making the tile pattern shown. The tile is a square with four circles of the same size inside. He will paint the circles blue and the remaining part of the tile yellow. Find the area of the portion of the tile that will be yellow.

Area of yellow portion is 30.96 sq. in

b. Find the area of the diamond-shaped piece in the middle of the tile.

Area of diamond-shaped piece is 7.74 in\(^2\)

c. What portion (percent) of the tile will be yellow?

\[ \frac{30.96}{144} = 21.5\% \]

Help students draw their ideas for finding areas of irregular shapes. For example, on #2 a student might draw a \(12\times12\) square then write “-“ four circles of radius 3 (see below). Transition student to then writing it as: \(12^2 - (4(3^2\pi))\) inches as they become ready.
8.1b Homework: Areas of Irregular Shapes

1. The following shapes have been drawn on square dot paper. The distance between each dot represents one unit. Use what you have learned about area to find the area of each shape (A-J). See Class Activity for sample problems similar to the ones below.

Solve the following area problems.

2 a. A rectangular lap pool with a length of 40 ft. and a width of 15 ft. is surrounded by a 5-ft. wide deck. Find the area of the deck.

2 b. Draw a picture of the deck if the deck is extended 3 feet in every direction, then find the area of the new deck. 1136 sq. ft.
3. A rectangular field with two semi-circles at each of the shorter ends of the field measures 100 yards long and 40 yards wide. It is surrounded by a track that is 5 yards wide. Find the area of the field which includes the two semi-circles on each of the shorter ends of the rectangle. Find the area of the track.

Area of the field is approximately 5256 sq. yds
Area of the track is approximately 1706.5 sq. yds

Discuss why these are approximations.

4. Laura is painting a sign for the new Post Office. She will paint the triangular portion blue and the lower rectangular portion red. Find the area of sign that she will paint blue. What percent of the sign will be in blue?

Spiral Review

1. Simplify the following:

\[2.6 + (-2.6) = 0\] (additive inverse)

\[\frac{1}{6} + \frac{3}{7} = \frac{7}{42} + \frac{18}{42} = \frac{25}{42}\]

2. Simplify the following expressions:

\[60 + 5x\]
\[17x - 61 - 12x = 5x - 61\]
\[9(5x) + 3x = 48x\]
\[37 - 6x\]

3. Anya and Bartholomew clean windows. Anya charges 50 cents per window plus $10 per job. Bartholomew charges 90 cents per window plus $6 per job. If on one job, they make the same amount of money, how many windows did they each clean?

\[0.5w + 10 = 0.9w + 6\]
\[w = 10\]

4. Alfonso is tossing his baby brother’s cylinder toy. The following table shows the results of the tosses. Based on the observations, what is the probability the cylinder will land on its side?

<table>
<thead>
<tr>
<th>Land on side</th>
<th>Land on top or bottom</th>
</tr>
</thead>
<tbody>
<tr>
<td>9</td>
<td>11</td>
</tr>
</tbody>

8.1c Class Activity: Areas of Irregular Shapes and Expressions

The goal in this section is to transition students to writing algebraic expressions for finding area of irregular polygons. Use your knowledge of area to find the area of the following shapes, if possible. Write an expression to show how you arrived at your answer.

1 a.  
A = 60 \times 100 = 6000 \text{ m}^2

1 b.  
Suppose you had a 60 \times 100 meter plot of ground on which you were going to plant a garden. In the corner of your plot you want to build 5 \times 8 storage shed. How much area will be left for your garden? Does it matter which way the storage shed is oriented?  
6000 – 40 = 5960 \text{ m}^2. It does not matter where you put it, the area will always be the same.

2 a.  
A = 60x \text{ m}^2

2 b.  
Suppose you have a 60 by 200 meter plot of ground on which you are going to plant a garden. You don’t want to plant the whole thing, just an area of 8000 \text{ m}^2. If one side is 60 meters, how long will the other side (the 200 meter side) have to be to have an area of 8000\text{m}^2? What percent of the other side would you be using?  
60x = 8000  
x = 400/3 or 133 1/3 meters  
(133 1/3)/200 = 66 2/3 %

2 c.  
What percent of your 60\times200 meter plot of ground will be planted?  
8000/12000 = 66 2/3 %
3. a

Area of Big Rectangle + Area of Medium Rectangle + Area of Small Rectangle
\[(60)(55) + (45)(34) + (12)(45)\]

or

Big rectangle – Little rectangle
\[(60)(100) – (14)(45) = \]

A = 5370 sq. m

3 b.

Area of Big Rectangle + Area of Medium Rectangle + Area of Small Rectangle
\[(60)(100 – x) + (34)(x) + (12)(x)\]

or

Big rectangle – Little rectangle
\[(60)(100) – (14)(x) = \]

A = 6000 – 14x sq. m

3 c. Suppose you’re building a rectangular storage enclosure. The base of the enclosure is to be 60 by 100 meters. You need to construct a ramp into the enclosure as illustrated in 3 b. How long should the ramp be if you want the remaining area to be 5250 m²?

\[6000 – 14x = 5250\]

\[x = \text{(approximately) } 53.57 \text{ meters}\]

For 4 – 8 only one method is shown. Student methods may vary.

4a.

Area of Big Rectangle – Area of Small Rectangle
\[\frac{9}{7} \cdot \frac{7}{8} - \left(\frac{1}{3} \cdot \frac{3}{5}\right)\]

or

Area of left rectangle + Area of right rectangle
\[\frac{9}{7} \cdot \left(\frac{7}{8} - \frac{1}{3}\right) + \left(\frac{1}{3} \cdot \left(\frac{9}{7} - \frac{3}{5}\right)\right)\]

A = \frac{37}{40} \text{ yds}

4b.

Area of Big Rectangle – Area of Small Rectangle
\[x \cdot \frac{7}{8} - \frac{1}{3} \cdot \frac{3}{5}\]

You may also add together the two smaller rectangles

\[
\frac{7}{8}x - \frac{1}{5}
\]
Write an expression to represent the indicated measure for each of the following irregular shapes.

5. Find the area and perimeter for the figure below.

Area of Big Rectangle + Area of Small Rectangle
\[ 5(3x) + 4x(14) = 15x + 56x = 71x \text{ sq units} \]
Perimeter: \[ 5 + 3x + 9 + 4x + 14 + 7x = 28 + 14x \text{ units} \]

Students might struggle with finding the length of the right side, help them see that it is \( 7x - 3x \).

The larger issue is helping students connect ideas about perimeter and area to addition and multiplication.

6. Find the area of the figure below.

Area of large Rectangle – Area of Triangle
\[ 12(d + 6) - 0.5(6)(12) = 12d + 72 - 36 = 12d + 36 \text{ sq. units} \]
or
Area of the small rectangle plus the triangle: \[ 12d + 0.5(6)(12) = 12d + 36 \text{ square units} \]
or
Area of a Trapezoid (“on its side”)
\[ 0.5(12)(d + 6 + d) \]
\[ 6(2d + 6) = 12d + 36 \text{ square units} \]

There are several ways students might find the area. Encourage students to find more than one way.

7. Find the area and perimeter of the figure below:

Area: \[ 15x(7) - 5(7x) = 105x - 35x = 70x \text{ square units} \]
or
\[ 5x(7) + 3x(7) + 2(7x) = 35x + 21x + 14x = 70x \text{ square units} \]
Perimeter: \[ 15x + 7 + 3x + 5 + 7x + 5 + 5x + 7 = 30x + 24 \text{ units} \]

8. Find the area of the figure below:

Area: \[ 9m(4m) + 0.5(6m)(4m) = 36m^2 + 12m^2 = 48 \text{ square m} \]
9. A bull’s eye is made of two concentric circles as shown below. The radius of the smaller circle is 4.5 inches. The larger circle has a radius of 9 inches.  
Use 3.14 to approximate \( \pi \) in calculating the area of:  
   a. The smaller circle 63.585 in\(^2\)  
   b. The larger circle 254.34 in\(^2\)  
   c. The space between the smaller circle and larger circle (the outer ring) 190.755 in\(^2\)  

Assuming the dart hits the target somewhere, what is the probability of hitting the smaller circle’s area? 63.585/254.24 approximately 25%  
d. What is the probability of hitting the outer ring? 190.755/254.34 or approximately 75%. Point out that there is really no need to compute this, given we know that the total probability must equal 1, hence 1 – (the probability of hitting the smaller target) gives us the probability of hitting the outer ring.

10. Find the area of the grey part of the figure below.  
Area of Big Circle – Area of Small Circle \( j^2 \pi – h^2 \pi \) or \( \approx 3.14j^2 – 3.14h^2 \)

11. The figure below shows a circle and a rectangle. The circle’s diameter is equal to the rectangle’s base. Find area of the shaded region and its perimeter. (use 3.14 for \( \pi \))  
Area of rectangle - Area of Semi-Circle  
\( (3x)(2x) – (0.5)(\pi)(x^2) \)  
\( 6x^2 – 1.57x^2 = 4.43x^2 \) square units;  
Perimeter: \( 8x + 0.5(2x)\pi = 11.14x \) units
8.1c Homework: Areas of Irregular Shapes and Expressions

Solve the following area problems. Write an expression showing how you got the area.

1. Find the area of the region.
   Area of Big Rectangle – Area of Small Rectangle
   \[
   \left( w + \frac{5}{9} \right) \left( \frac{2}{3} w \right) - \left( w + \frac{1}{3} \right) \left( \frac{1}{9} \right) \\
   \frac{2}{3} w^2 + \frac{10}{27} w - \frac{1}{27} \text{ square units}
   \]

2. Find the perimeter and area of the region.
   (use 3.14 for pi)

3. Jeremy needs to buy soil for the garden spot in his backyard. A sketch of the plot is to the right.
   a. Find the area of the garden.
   b. How many cubic feet of soil will he need to buy if he covers the area in 6 inches of soil?
   c. How many cubic feet of soil will he need to buy if he covers the area in one and a half feet of soil?
   d. How many feet of fencing will he need to enclose the garden if he fences the exact shape of the garden?
4. Nico is building a deck around the circular pool in his backyard. The pool has a radius of 15 ft. The deck will be 5 ft wide.

a. Find the area of the deck.

Area of the Outer Circle – Area of the Inner Circle

\[\pi (20)^2 - \pi (15)^2\]

Area of the deck is 549.5 ft\(^2\)

5. a. A stage with a trapezoidal area upstage and a rectangular area downstage is illustrated in the figure to the right. Find the area of the stage.

b. What is the area of just the rectangular portion of the stage?

c. What portion of the stage is the rectangular portion?

6. Rachel is painting a sign for the new Health Center. Find the area of sign that she will need to paint red if she paints the entire area red.

Suppose Rachel decides to paint the lower portion (the 3 \times 1 bottom portion, shown below the dotted line) of the sign blue. What percent of the sign would be blue?
Write an expression to represent the **white area** of the following irregular shapes.

**7.**

\[
\begin{array}{c}
8n \\
17 \\
2n \\
13 \\
6n \\
\end{array}
\]

Find the perimeter of this region:

**8.**

\[
\begin{array}{c}
b+7 \\
8 \\
\end{array}
\]

**9.**

\[
\begin{array}{c}
4x \\
2 \\
6x \\
2 \\
6x \\
\end{array}
\]

**10.** The circle has a radius of 2y.

Area of Circle – Area of Rectangle

\[
\pi(2y)^2 - (y)(2y)
\]

10.56y² sq units
11. \[
\begin{align*}
\text{Area of Semi-Circle + Area of Triangle + Area of Rectangle} \\
&= \frac{1}{2} \pi \left( \frac{3}{4} \right)^2 + \frac{1}{2} (w) \left( \frac{3}{2} w - \frac{1}{2} \right) + w \left( \frac{1}{2} \right) \\
&= \frac{3}{2} w^2 + \frac{1}{4} w + \frac{1}{32} \pi
\end{align*}
\]

13. or Area of Semi-Circle + Area of Trapezoid
\[
\begin{align*}
&= \frac{1}{2} \pi \left( \frac{3}{4} \right)^2 + \frac{1}{2} \left( \frac{3}{2} w + \frac{1}{2} \right) \\
&= \frac{3}{4} w^2 + \frac{1}{4} w + \frac{1}{32} \pi
\end{align*}
\]
Spiral Review

1. Write and solve a proportion to find what percent of 27 is 3? \[ \frac{3}{27} = \frac{x}{100}. \quad x = \frac{300}{27} = 11.111\ldots\% \]

2. A local college football team is known for its awesome offense. The table below shows a season’s rushing yards for 9 players. Find the mean absolute deviation of their rushing yards. 121.777…

<table>
<thead>
<tr>
<th>Rushing Yards</th>
</tr>
</thead>
<tbody>

</tr>
<tr>
<td>1</td>
</tr>
</tbody>
</table>

3. Two angles are supplementary. One angle is 49 degrees less than the other. What are the measures of each angle? 65.5° and 114.5°

4. Write 0.672 as a percent. 67.2 %

5. Sam has lots of bracelets. She gets 3 more bracelets. Then she sells \(\frac{1}{3}\) of the bracelets. Write two different equivalent expressions showing how many bracelets Sam has left.
   \[ \frac{2}{3}(x + 3) \]
   \[ \frac{2}{3}x + 1 \]
   \[ \frac{2}{3}(x) + \frac{2}{3}(3) \]
8.1d Class Activity: Review Areas of Triangles, Parallelograms, Trapezoids; Circle Area and Circumference

Activity: In pairs, answer each of the following. Use a model to justify your answer.

1. Look back at question #3 from your homework (8.1c). How much more soil will Jeremy need to buy if he decided to cover his garden in 1.5 feet of soil rather than six inches of soil? Give your answer as a scale factor (twice as much? Three times as much? 1.5 times as much?) Explain:
   3 times as much; $3 \times 0.5$ feet is 1.5 feet.

2. Kara and Sharice are in a quilting competition. Both are stitching rectangular-shaped quilts. So far Kara’s has an area of 2,278 square inches with a height of 44 inches. Sharice’s quilt has an area of 2,276 square inches with a height of 47 inches. Whose quilt is wider? By how many inches is it wider?

   The width of Kara’s quilt is 51.77 in. The width of Sharice’s quilt is 48.43 in.
   Kara’s quilt is wider by 3.34 in.

3. Rufina bought two 12-foot pieces of lumber and two 8-foot pieces of lumber to create a border for her garden in her yard. She wants to use all the wood to enclose her garden. How should she use the four pieces to create a rectangular garden of largest possible area? What is the largest area she can get with her four pieces of wood?

   Rufina has 40 linear feet of wood with which to create a garden. Encourage students to try a variety of configurations: a 12 ft × 8 ft garden would give an area of 96 ft$^2$, a 15 ft × 5 ft would give and area of 75 ft$^2$, etc. Ask students what they notice happening? Help them discover that a 10 ft × 10 ft garden would result in the largest area of 100 ft$^2$.

4. A triangle has an area of 90 square centimeters.
   a. If its height is 15 cm, what is the length of the base?
   b. Draw a triangle with an area of 90 square centimeters, height of 15 cm and base you found in part a. Is there more than one triangle you can draw with those dimensions?
   c. Draw a triangle that has an area that is 150% of the original 90 cm$^2$ triangle. What are the dimensions of your larger triangle?
      a. Base is 12 cm
      b. Drawings might be vary  Yes, infinitely many triangles with those dimensions
      c. Original triangle had $b = 12$ cm, $h = 15$ cm, and $A = 0.5(12 \text{ cm})(15 \text{ cm}) = 90 \text{ cm}^2$. We want $A = 1.5(90) \text{ cm}^2$ or 135 cm$^2$. One way: $135 = 0.5(15)b$, so $b = 18$ cm. There are other answers.
5. Julius drew a trapezoid that had bases of 15 and 11 inches and a height of 4 inches.
   a. What is the area of the trapezoid Julius drew?
   b. Can you draw a trapezoid that has the same area, but different dimensions?
   c. Draw a trapezoid with the same height but with bases that are a 5/2 scale factor of the original trapezoid.
   d. What is the area of the new trapezoid?

   a) $A = 52 \text{ in}^2$
   b) answers will vary
   c) The base of 15 will be $75/2$ or 37.5 inches and the 11 base will become $55/2$ or 27.5 inches. The height remains the same.
   d) $A = 0.5(4)(37.5 + 27.5) = 130 \text{ in}^2$

   Notice again that the area changed by the same scale factor (this happened with #4 also). We only changed one dimension, not both, so the area changed in the same way. In other words, if we scaled both the height and base by 5/2, our area would scale by $(5/2)^2$, but because we only changed one dimension, our area scaled by one factor of 5/2. Discuss this point with students.

Review: These ideas are review from chapter 5.
Draw a model and explain how to find the circumference of a circle:

Draw a model and explain how to find the area of a circle:

6. You’re making a 12 inch diameter pizza. You want the sauce to cover the pizza with a 1.5 inch ring left around the outside without sauce. (Use 3.14 as an approximation for pi.)
   a. What is the area that the sauce will cover?
      If $D = 12$ in, $r = 6$ in. We want a 1.5 inch ring, so we use $r = 4.5$. Area of the sauce is $63.585 \text{ in}^2$
   
   b. What percent of the dough will be covered be sauce?
      About 56%  
   
   c. If one 8 oz can of tomato sauce covers about 125 sq. inches of pizza dough, how many cans of sauce will you need to buy?
      I can of tomato sauce
7. A circular swimming pool with a diameter of 32 feet is located exactly in the middle of a 40 ft × 40 ft square lot. For safety reasons the lot needs to have an 8 ft fence on the perimeter of the entire lot.
a. How long will the fence need to be?
   \[ P = 160 \text{ feet} \]

b. If the fence was around only the circular pool, how long would the fence be?
   \[ C = 100.48 \text{ feet} \]

c. Explain how much longer a fence around the whole yard is than a fence only around the pool using percent increase.
   \[ 59\% \text{ increase} \]

d. What percent of the yard area does the pool take up?
   \[ \text{About 50.2\%} \]

e. What is the area of the yard NOT taken up by the pool?
   \[ \text{About 49.8\%} \]

8. Look back at question #4 from the homework (8.1c). Nico’s pool currently takes up approximately 706.5 ft\(^2\) of space in his yard (using 3.14 as an approximation for pi). If Nico adds the five foot deck around the pool, what percent increase of space will this be?

   Old area = 706.5 ft\(^2\); new area is \(400\pi\text{ ft}^2\) or approximately \(1,256\text{ ft}^2\). \(1,256/709.5 = 1.778\). Thus the pool with the deck is now \(177.778\%\) the area of just the pool alone. Notice that the scale factor from the 15 foot radius to the 20 foot radius is \(4/3\), so the percent increase will be \((4/3)^2\). Clarify with students that for finding area of a circle, the radius is squared (review with them why this is true from the picture they drew before doing #6), thus when this length is increased by a scale factor of \(4/3\), the area will scale at \((4/3)^2\).
8.1d Homework: Review Areas of Triangles, Parallelograms, Trapezoids; Circle Area and Circumference

1. Wallpaper comes in rolls that are 60 feet long and 2 feet wide. How many rolls of wallpaper will it take to cover 700 square feet?

6 rolls of wallpaper—talk about this with students. One roll covers 120 ft² of area. Five rolls cover 600 ft², so you’ll need a 6th roll. There will be 20 ft² left over.

2. A rectangular garden has an area of 45 square feet. One of the sides is 6 feet.
   a. What is the other side?
   b. You want to put a fence around it. How long will the fence need to be?
   c. You decide you want to increase the length of each side by a scale factor of 3.2. What are the new dimensions of your garden?
   d. What is the area of your new garden?

3. Mrs. Garcia has a table shaped like an isosceles trapezoid in her third grade classroom. The two parallel sides have lengths of 6 feet and 8 feet. The distance between them is 4 feet.
   a. What is the area of the top of Mrs. Garcia’s table?
   b. Suppose Mrs. Garcia has a 1.75 ft by 0.8 ft puzzle on the table. How much surface area is now available on her table?

4. The diameter of the earth is about 7926 miles.
   a. Find the distance around the earth at the equator.

Using a diameter of 7926 miles and 3.14 for pi, the distance around the Earth at the equator is approximately 24,862.52 miles

   b. If there are 5280 feet in every mile, what is the distance around the Earth in feet?
   \[ 24862.52 \times 5280 = 131,274,105.6 \text{ feet}. \]

   c. Suppose you can jog at a rate of 2 miles every 15 minutes. At this rate, how long would it take you to walk around the Earth?
   \[ 24,862.52(15/2) = 186,468.9 \text{ minute}; 186,468.9/60 = 3,107.815 \text{ hours}; 3,107.815/24 = 129.49 \text{ days} \]
   IF you walked 24 hours a day 7 days a week. If you walked 10 hours a day (3,107.815/10), it would take 310.7815 10 hour days of walking. Of course, we’re assuming that one could actually walk around the equator, there’s actually a lot of ocean to contend with.
5. A 12 foot by 16 foot rectangular office is being sectioned off into two triangular areas so that desks can be placed in opposite corners. The diagonal of the office (from corner to corner) is 20 feet. The manager needs a dividing curtain to hang from the ceiling around one of the triangles.

a. How long does the curtain need to be?

b. The carpet in each section will be a different color. How many square feet of carpet will be needed to cover each triangular section?

6. The three-point line in basketball is approximately a semi-circle with a radius of 19 feet and 9 inches. The entire court is a rectangle 50 feet wide by 94 feet long. What is the approximate area of the court that results in 3 points for a team?

\[ A = 94 \times 50 - 0.5 \times 19.75^2 \pi \approx 2043.8 \text{ ft}^2 \] (rounded the area of the circle to the nearest sq. ft).

7. Your neighbor’s backyard lawn is shaped like a rectangle. The back fence is 38.2 feet long and the side fence is 32.6 feet long. He will pay you $0.04 per square foot for mowing and $0.11 per foot for trimming all the edges. How much will you get paid total for mowing and trimming? Remember to show all your work.

8. You’re the manager of a county recreation center that has a 50 by 25 meter rectangular pool. Currently, there is an 1.5 meter cement walkway around the pool (see diagram). The community is concerned about the safety of the walkway and would like to cover it with a non-slip rubber substance that costs $78 a square meter to be installed. The county has budgeted $15,000 for the project. Is that enough money to cover the walkway? Explain you answer.
Spiral Review

1. A hot tub is surrounded by a square deck as pictured to the right. What is the area of the deck?
   \[ \text{Area} = (180 \text{ in})^2 - \pi (83 \text{ in})^2 \approx 21,631.46 \text{ in}^2 \]

2. Cristian is building a rectangular garden in his backyard. The width of the garden is set at 29 inches. He wants the fence to be 5 inches longer than the garden on each side. If he wants the area enclosed by the fence to be 2028 square inches, how long should the garden be?
   \[(29 + 5 + 5)(x + 5 + 5) = 2028\]
   \[39(x + 10) = 2028\]
   \[x = 42\]
   42 inches long

3. Eugene’s math class has 20 boys and 10 girls. If the teacher draws a student’s name at random for a candy bar, what is the probability Eugene will be chosen? What is the probability that a girl will be chosen?
   \[P(\text{Eugene}) = \frac{1}{30}; \quad P(\text{girl}) = \frac{10}{30} = \frac{1}{3}\]

4. There are a total of 214 cars and trucks on a lot. If the number of cars is four more than twice the number of trucks, how many cars and trucks are on the lot?
   \[(2t + 4) + t = 214\]
   \[3t = 210\]
   \[t = 70\]
   trucks = 70
   cars = 144

5. \[-1(-4)(-7) = -28\]

Sample Problems for Section 8.1

1. Use the given information to find the missing information. Round each answer to the nearest hundredth unit.
   a. Diameter: 18 km
      Circumference: ____________
   c. Circumference: 50.24 in
      Radius: ____________
   b. Radius: 0.1 m
      Area: ____________
   d. Area: 105.63 in²
      Radius: ____________

2. Answer the following questions using the object pictured.
   a. Find the perimeter and area of the object to the left.
   b. What percent of the total area is the area of one of the outer squares in the object to the left?
   c. Phoebe is buying an L-shaped desk. How much area will the desk pictured take up in her apartment?

3. Explain the difference between perimeter and area in words and/or pictures. Use the figure in 2c to help you in your explanation.
4. Use the rectangle to the right to answer the following questions:
   a. What is the perimeter?
   
   b. What is the area?
   
   c. If the perimeter is 1098 units, what is the value of $x$?

5. The dimensions of Gabrielle’s rectangular garden are 12 feet by 16 feet. Daniel is building a garden. He is going to decrease the dimensions by 25%.
   a. Find the perimeter and area of each garden.
   b. Find the percent of decrease between the perimeters of each garden.
   c. Find the percent of decrease the areas of each garden.
   d. In general, how are the percents of change of perimeters and areas of scaled objects related?
Section 8.2: 2D Plane Sections from 3D Figures and 3D Measurement

Section Overview:

The goal of this section is to help students better understand: a) attributes of various prisms, b) how those attributes affect finding the surface area and volume of different prisms, c) the relationship between measurements in 1-, 2-, and 3-dimensional figures and d) connect ideas of scale factor/percent change to ideas of surface area and volume. Students begin this section by examining three-dimensional figures. They should observe which faces for an object are parallel and/or perpendicular and which are the same size and shape. Students quickly move to taking cross-sections of various figures to notice what two dimensional shapes are generated by different types of cuts. Attention will be paid to when parallel plane sections generate surfaces that are the same and when they are different. The exercises in this section are designed to solidify students’ understanding of the algorithms for finding perimeter, area, and volume. Additionally, exercises should help students better understand units of measure for perimeter, area, and volume. Next, students examine the nets of 3D figures. Nets were introduced in 6th grade; in 7th grade, students extend their understanding by differentiating surface area from volume. Students will use their understanding of surface area and volume to solve various problems. Specifically, attention will be paid to scale factor and percent change in problems involving volume and surface area.

Concepts and Skills to be Mastered (from standards)

1. Describe the two-dimensional figures that result from slicing three dimensional figures.
2. Solve real-world and mathematical problems involving volume and surface area of three-dimensional objects composed of triangles, quadrilaterals, polygons, cubes, and right prisms.

Background knowledge for making and describing 2D cross-sections:

- Right regular polyhedron prisms are three dimensional figures with at minimum two parallel polygonal faces of the same size and shape (called bases); remaining lateral faces are rectangles not necessarily the same as the bases (note that the base may be any polygon but the lateral faces are always rectangles.)
- Right cylinders have parallel circular bases of the same size (radii are equal) whose centers are aligned directly above each other (centers lie on a line that is perpendicular to both bases).
- There are several ways to take plane sections of a prism or cylinder (for the descriptions below, we assume the prism or cylinder is standing on one of its bases):
  - Parallel to the base
  - Perpendicular to the base
  - Slice at an angle (in a tilted direction) to the base
- A cross-section is a special type of plane section cut perpendicular to a face or base. Most cuts in this section will be cross-sections.
- “Equidistant” means an equal distance. “Vertices” are the corners of the figure.
8.2a Class Activity: 2D Plane Sections of Cubes and Prisms (play dough & dental floss)

Students can make their own play-dough using the provided recipe at the end of the chapter OR you may use the links below to view demonstrations of plane sections OR you might use a combination of the two.  
http://www.learner.org/courses/learningmath/geometry/session9/part_c/index.html  
http://www.shodor.org/interactivate/activities/CrossSectionFlyer/  
Review vocabulary (side, vertices, face, edge) with students. Many ideas will be explored in this section, take time to discuss concepts thoroughly with students.

OBJECTIVE THROUGHOUT PLANE SECTION EXERCISES: STUDENTS WILL UNDERSTAND WHEN THEY CAN MAKE PARALLEL PLANAR CUTS THAT GENERATE EQUAL SECTIONS. This will lead into ideas about volume.

1. Mold a CUBE from play-dough.

<table>
<thead>
<tr>
<th>Perform the following cuts.</th>
<th>Sketch where you cut</th>
<th>Sketch the exposed surface(s).</th>
<th>NOTES</th>
</tr>
</thead>
<tbody>
<tr>
<td>a. Cut parallel to the base.</td>
<td></td>
<td>Square</td>
<td>Examine the prism with students. Note parallel and perpendicular sides. Also note number of faces and that the faces are all the same size and shape.</td>
</tr>
<tr>
<td>b. Cut parallel to the base again, but at a different distance from the base.</td>
<td></td>
<td>Discuss what would happen if the cube was placed on a different face.</td>
<td>How does the new exposed surface compare to the previous surface? It’s the same (this will not be true when they do spheres.)</td>
</tr>
</tbody>
</table>

What is true about all cuts of a cube parallel to the base? You always get a cross section that is a square surface that is the same as the face of the cube.

What is true about other cuts of a cube NOT parallel to the base but through at least one lateral face? You get different polygons—have students explore this.

c. Cut perpendicular to the base and parallel to a face.  
|                      | | If the cut is parallel to a face (and thus perpendicular to the base), then all cross sections will be a square. |
d. Cut perpendicular to the base and parallel to a face again, but at a different location on the cube.  
|                      | Ask students to make cuts perpendicular to the base but not parallel to any of the faces. Discuss the cross sections they find. | How does the new exposed surface compare to the previous surface? All plane sections parallel to a face will be a square |

What is true about all cuts of a cube perpendicular to the base and parallel to a face? You always get a surface that is the same as the face of the cube.

What is true about cuts of a cube perpendicular to the base but not parallel to a face? You get rectangles that are not necessarily the same, neither shape nor size.
2. Mold a **CUBE** again. Perform a single cut to create the following:

<table>
<thead>
<tr>
<th>Create…</th>
<th>Sketch where you cut</th>
<th>NOTES</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>a. Triangle</strong>&lt;br&gt;ask students if they can create an equilateral, isosceles and/or scalene triangle</td>
<td><img src="image" alt="Cube Sketch" /></td>
<td>Discuss the characteristics of cuts needed to make different triangles. e.g. for an equilateral triangle, the cut must intersect three edges the same distance (equidistant) from a vertex. Help students attend to precision and use appropriate language such as face, edge, vertex, side, plane, equidistant, parallel, perpendicular, etc. Throughout these exercises, it will be helpful to have students try to draw where the plane cuts the solid figure.</td>
</tr>
<tr>
<td><strong>b. Square</strong></td>
<td><img src="image" alt="Cube Sketch" /></td>
<td>Ask students to describe from where each side of the plane section came. Answer: each side of the plane section is a line from a face of the cube. In other words, to get a triangle, the plane section must pass through three sides, for a quadrilateral it must pass through four sides. Students may believe that a cut diagonally through a face and perpendicular to the opposite face will result in a square. Help them see that the diagonal is not equal to an edge length.</td>
</tr>
<tr>
<td><strong>c. Rectangle</strong></td>
<td><img src="image" alt="Cube Sketch" /></td>
<td>A cut perpendicular to the base but not parallel to a face will result in a rectangle. A cut through the diagonal of a face perpendicular to the opposite face results in a rectangle. All cuts perpendicular to the base result in a rectangle. All such rectangles will have two sides equal to the length of a face. The other two sides will vary in length.</td>
</tr>
<tr>
<td><strong>d. Pentagon</strong></td>
<td><img src="image" alt="Cube Sketch" /></td>
<td>This will be difficult for students. Help them understand that to get a five sided polygon, the cut must pass through five sides of the cube. Also note that the vertices of the plane section come from the edges of the cube.</td>
</tr>
<tr>
<td><strong>e. Hexagon</strong></td>
<td><img src="image" alt="Cube Sketch" /></td>
<td>A hexagon can be created by cutting/passing through all six faces of the cube. Remember, the cut must be straight—students will want to make “curved” cuts. Note that no other polygons can be made by plane sections because there are only 6 sides of a cube.</td>
</tr>
<tr>
<td><strong>f. Circle or Trapezoid</strong></td>
<td><img src="image" alt="Cube Sketch" /></td>
<td>Not possible.</td>
</tr>
</tbody>
</table>
3. Mold a Right **RECTANGULAR PRISM** (that is not a cube.)

<table>
<thead>
<tr>
<th>Perform the following cuts.</th>
<th>Sketch where you cut prism may be turned the other way</th>
<th>NOTES: describe the plane section and what might happen with other similar cuts.</th>
</tr>
</thead>
<tbody>
<tr>
<td>a. Cut parallel to the base.</td>
<td><img src="image1.png" alt="Sketch" /></td>
<td>Examine the prism with students. Note parallel and perpendicular faces. Also note number of faces and if the faces are of the same size and shape. Discuss what would happen is the prism were placed on a different face.</td>
</tr>
<tr>
<td>b. Cut parallel to the base again, but at a different distance from the base.</td>
<td><img src="image2.png" alt="Sketch" /></td>
<td>All cuts parallel to the base result in a plane section the same size and shape as the base.</td>
</tr>
<tr>
<td>c. Cut perpendicular to the base and parallel to a face.</td>
<td><img src="image3.png" alt="Sketch" /></td>
<td>All cuts parallel to the base, regardless of its distance from the base, result in plane sections that are the same (this will not be true when students cut pyramids or spheres). Ask students to make a conjecture about why all these plane sections are all the same. Have students make cuts NOT parallel to the base but through at least two lateral faces and note what happens—this will result in polygons that are not all the same.</td>
</tr>
<tr>
<td>d. Cut perpendicular to the base but not parallel to a face.</td>
<td><img src="image4.png" alt="Sketch" /></td>
<td>All plane sections parallel to a face will be the same as the face the cut is parallel to.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>These plane sections are not all the same. All are rectangles with heights equal to the face heights, but bases of the rectangles will vary.</td>
</tr>
</tbody>
</table>

What is true about all cuts of a rectangular prism parallel to the base? **The plane section will always be the same as the base of the prism.**

What is true about cuts of a rectangular prism NOT parallel to the base? **The plane sections will NOT all be the same as the base.**

What is true about all plane sections of a rectangular prism perpendicular to the base and parallel to a face? **The surface will be the same as the face of the prism.**

What is true about any plane section of a rectangular prism perpendicular to the base but not parallel to a face? **The plane sections will vary.**
4. Mold a **SPHERE**.

<table>
<thead>
<tr>
<th>Perform the following cuts.</th>
<th>Sketch where you cut</th>
<th>NOTES: describe the plane section and what might happen with other similar cuts.</th>
</tr>
</thead>
<tbody>
<tr>
<td>a. Cut parallel to the table at different distances from the table.</td>
<td><img src="image1" alt="Sketch" /></td>
<td>Discuss the figure with students. Ask students how the sphere is different than a right prism. Students may note: it doesn’t have “sides”, no “base”, no matter how it’s oriented, it always looks the same. Ask students how a sphere is related to a circle: a circle is the locus of points in a <em>plane</em> all equidistant from a fixed point, while a sphere is the locus of points in <em>space</em> all equidistant from a fixed point. Students will likely be comfortable with the idea that plane sections are all circles, of different sizes, for cuts <em>parallel</em> to the table regardless of where the cut is made.</td>
</tr>
<tr>
<td>b. Make cuts that are not parallel to the table.</td>
<td><img src="image2" alt="Sketch" /></td>
<td>Students might find it hard to understand why cuts regardless of the angle, of a sphere always results in a circle. Some students may believe that cuts of various angles will result in an ellipse. Help students understand that because a sphere has no “base”, orientation of the cut does not affect the plane section.</td>
</tr>
</tbody>
</table>

**What is true about all cuts of a sphere parallel to the table?** They are all circles of various sizes.

**What is true about all cuts of a sphere NOT parallel to the table?** They are all circles.

c. Cut perpendicular to the table. | ![Sketch](image3) | Review the mathematical foundations document for ideas on how to extend concepts with perpendicular cuts. The radius of the circle (size) changes as the distance from the table changes. All circles are scaled versions of each other (similar.) |
| d. Cut perpendicular to the table again, but at a different location on the sphere. | ![Sketch](image4) |

**What is true about all cuts of a sphere?** Regardless of where the cut is made, you always get a circular surface.
5. Make a cube and a rectangular prism like in exercises #1 and #3 again. Orient them as in the figure below:

| ![Cube](image1.png) | ![Rectangular Prism](image2.png) |

What is the shape of the base of the cube and the rectangular prism? **Cube → square; prism → square**

Will all cuts parallel to the base result in the same planar figure for the cube? **Yes, they will all be squares.**

Will all cuts parallel to the base result in the same planar figure for the rectangle prism? **Yes, they will all be squares.**

Help students understand that the volume of either can be thought of as area of the base times the height.

Now rotate each 90° as shown in the figure below:

| ![Cube](image3.png) | ![Rectangular Prism](image4.png) |

What is the shape of the base of the cube and the rectangular prism now? **Cube → square; prism → rectangle**

Will all cuts parallel to the base result in the same planar figure for the cube? **Yes, they will all be squares.**

Will all cuts parallel to the base result in the same planar figure for the rectangle prism? **Yes, they will all be rectangles the same size as the base (face touching the table).**

Again, discuss with students that volume can be represented as area of the base times the height. Help them see how this is connect to \( l \times w \times h \). This will be explored further for the cylinder and triangular prism in the next lesson.

6. Compare and contrast plane sections of rectangular prisms, cubes and spheres.

**Possible responses from students:**

For prisms, students will observe that restricting cuts to being parallel to the base will always result in plane sections of the same size and shape as the base.

Cuts parallel to a face will result in cross-sections of the same size and shape as the face only if the base is rectangular. In the next section students will cut triangular prisms. You may want to discuss this further then.

All cuts parallel to a face will be perpendicular to the base for a right prism.

Cuts perpendicular to the base but not necessarily parallel to a face.

Various cuts perpendicular to the base will not necessarily result in cross-sections that are all the same size and shape, however they will all be quadrilaterals when cutting rectangular prisms.

Cross-sections of spheres are always circles, but the size of the circle varies depending on how far from the center the cross-section was taken.
8.2a Homework: 3D Objects

Use your knowledge of each three-dimensional object to answer the following questions.

Cubes
1. How many faces does a cube have?
2. What do you know about each face of a cube?
3. How many edges does a cube have?
4. How many vertices does a cube have?

Rectangular Prisms
5. How many faces does a rectangular prism have?
6. How many edges and vertices does a rectangular prism have?
7. How are a rectangular prism and a cube similar and different?

Sphere
8. Does a sphere have any edges or vertices?
9. What makes a sphere different from all the other 3D objects named above?
Spiral Review

1. Find the area of each figure below:
   a. 
   ![Rectangle](image)
   b. 
   ![Circle](image)
   c. The figure below is a square.
   ![Square](image)
   d. 
   ![Triangle](image)

2. Simone rolls a die 64 times. Approximately, how many times will she roll a 6? \( \frac{1}{6} \times 64 \approx 10 \text{ – 11} \)

3. Find the unit rate for BOTH units.
   Izzy drove 357 miles on 10 gallons of gasoline.
   \[ \frac{357}{10} = \frac{35.7 \text{ miles}}{1 \text{ gal}} \text{ and } \frac{10}{357} = \frac{0.028 \text{ gal}}{1 \text{ mile}} \]

4. Convert the following units using the ratios given:
   
   \[ \frac{3 \frac{1}{12}}{1} \text{ feet} = 37 \text{ inches} \] (1 foot = 12 inches)

5. The temperature at midnight was 8°C. By 8 am, it had risen 1.5°C. By noon, it had risen another 2.7°C. Then a storm blew in, causing it to drop 2.7°C by 6 pm. What was the temperature at 6 pm? 9.5°C
# 8.2b Class Activity: 2D Plane Sections on Cylinders and More

Note: volume of cylinders is an 8\textsuperscript{th} grade topic. Plane sections are addressed here as a way to explore differences in right solids.

1. Mold a right \textbf{CYLINDER}, put the circular base on the table.

<table>
<thead>
<tr>
<th>Perform the following cuts.</th>
<th>Sketch where you cut</th>
<th>NOTES: describe the plane section and what might happen with other similar cuts.</th>
</tr>
</thead>
<tbody>
<tr>
<td>a. Cut parallel to the base.</td>
<td><img src="cylinder.png" alt="Cylinder" /></td>
<td>Discuss attributes of cylinder with students. Help students recognize that the lateral face of the cylinder is continuous and how it is related to the circumference of the base; e.g. the base length of the lateral face is the circumference of the base of the cylinder. You might help students recognize that the lateral face is a rectangle with base = C and height = height of cylinder. All cuts parallel to the base result in a circular plane section. All circles are the same size and shape as the base.</td>
</tr>
<tr>
<td>b. Make cuts not parallel to the base but through the lateral face of the cylinder.</td>
<td><img src="cylinder.png" alt="Cylinder" /></td>
<td>There are several ways one might make a cut that’s not parallel to the base: 1) through the lateral face only. These cuts will be elliptical. 2) Through one base and the lateral face. This cut will have a straight side (the one generated by going through the base, and then a curved side—an ellipse with a portion cut out of it. 3) through both the bases. This will look like an ellipse with two ends cut off.</td>
</tr>
</tbody>
</table>

What is true about all cuts of a cylinder parallel to the base? You always get circles of the same size as the base (same radius).

What is true about all cuts of a cylinder NOT parallel to the base? Students will not get circles. Discuss why this is true. Discuss how these plane sections differ from plane sections of spheres.

c. Cut perpendicular to the base. | ![Cylinder](cylinder.png) | These cuts will result in rectangles. Take time to discuss and have students experiment with this. |

d. Make cuts that go through at least one base of the cylinder but are not perpendicular to the base. | ![Cylinder](cylinder.png) | See b. above. |

What is true about all cuts of a cylinder parallel to the base? They are all circles of the same size as the base.

What is true about cuts of a cylinder perpendicular to the base? All will result in different rectangles.

What is true about any other cut (NOT parallel to the base or perpendicular to the base)? These result in various plane sections.
2. **Make a TRIANGULAR-BASED RIGHT PRISM.** Put the triangle base on the table.

<table>
<thead>
<tr>
<th>Perform the following cuts.</th>
<th>Sketch where you cut</th>
<th>NOTES: describe the plane section and what might happen with other similar cuts.</th>
</tr>
</thead>
<tbody>
<tr>
<td>a. Cut parallel to the base.</td>
<td><img src="image" alt="Sketch" /></td>
<td>Discuss attributes of the prism with students. Help students recognize that one might see the lateral surface area of this prism as three separate rectangles with base $b$ and height $h$ OR as one large rectangle of base $3b$ and height $h$. Also discuss with students why we are choosing the triangular faces to be the base.</td>
</tr>
<tr>
<td>b. Make cuts that are not parallel to the base but go through at least one face of the prism.</td>
<td><img src="image" alt="Sketch" /></td>
<td>These cuts will result in different polygons.</td>
</tr>
</tbody>
</table>

What is true about all cuts of a triangular prism parallel to the base? **They all result in triangular plane sections that are the same size and shape as the base.**

| c. Cut perpendicular to the base. | ![Sketch](image)       | Students might expect that cuts perpendicular to the base and parallel to a face result in plane sections that are the same size and shape as the face. But in this case the plane section will not be the same shape as the face. Indeed, plane sections will be rectangular, with heights equal to the height of the prism but they will have varying bases. You might ask students if this is because there are an odd number of faces (this is only part of the issue, a right prism with a hexagonal base will also not give plane sections of the same size and shape as a face with a cut that is perpendicular to the base and parallel to a face). Only a right prism with four congruent faces results in plane sections perpendicular to the base and parallel to a face that are the same size and shape as the face. |

What is true about all cuts of a triangular prism perpendicular to the base? **The plane section will be a rectangle of the same height as the prism but with different lengths for the base of the rectangle.**

The result of 2c should lead to a discussion about volume and orientation (volume for right prisms is area of the base multiplied by the height. This “works” because all plane sections of right prisms parallel to the base are the same size and shape.) Only for right rectangular prisms can we change its orientation and still use the same values to find volume. If a right prism that has a non-parallellogram base, the easiest way to find its volume is to choose for the base a face that has an opposite face that is the same size and shape. In the case of a triangular prism, orienting it as seen in the picture above means we can find the volume simply by finding the area of the base and then multiplying it by the height. If we rotate the prism 90 degrees (lay it on its side), we cannot merely find the area of the rectangular base and multiply it by the height (height of the triangle) because all the plane sections are not the same.
3. Make a **SQUARE-BASED RIGHT PYRAMID**. Put the square base on the table.

<table>
<thead>
<tr>
<th>Perform the following cuts.</th>
<th>Sketch where you cut</th>
<th>NOTES: describe the plane section and what might happen with other similar cuts.</th>
</tr>
</thead>
<tbody>
<tr>
<td>a. Make cuts parallel to the base.</td>
<td><img src="image" alt="Diagram" /></td>
<td>Discuss attributes of pyramid with students. Help students see that there is only one base and why each of the lateral faces are of the same size and shape for this prism—the base is square and the height of the prism is on a line perpendicular to the base at its “center.” Review concepts from the mathematical foundations document for how you might discuss the solid. All cuts parallel to the base result in squares, however squares are of different sizes. You might discuss with students that the size of the squares are changing at a constant rate as plane sections move up the height. Thus, the rate of change for the measure of the square plane section is affected by the height of the pyramid. These ideas will be explored further in math beyond this course.</td>
</tr>
</tbody>
</table>

What do you notice about cuts of a square-based pyramid parallel to the base? **Continue the discussion about volume from #2.** Help students see that finding the area of the base and then multiplying it by the height will not result in the volume of a pyramid (plane sections change as we move up the height), but that we can intuitively see a scale factor affecting the base of the square plane sections—all the squares are scaled versions of each other.

| b. Cut perpendicular to the base and parallel to one of the base’s edges. | ![Diagram](image) | All cuts will form trapezoids with one base the same for all trapezoids. Discuss with students that the cross-section passes through four faces. |
| c. Cut perpendicular to the base again, but at a different location on the pyramid. | ![Diagram](image) | If the cut passes through only three faces, the cross-section will be a triangle. Plane sections will vary. |

What do you notice about cuts of a triangular pyramid perpendicular to the table? **Students should notice that no matter how one cuts a pyramid, the resulting plane sections vary.**
4. Make a cylinder and a triangular prism like in exercises #1 and #2 again. Also make a rectangular prism. Orient them as in the figure below:

What is the shape of the base of the cylinder? Circle
What is the shape of the base of the triangular prism? Triangle
What is the shape of the base of the rectangular prism? Rectangle
Will all cuts parallel to the base result in the same planar figure for the cylinder? Yes, they will all be circles
Will all cuts parallel to the base result in the same planar figure for the triangular prism? Yes, they will all be triangles
Will all cuts parallel to the base result in the same planar figure for the rectangular prism? Yes, they will all be rectangles
Thus, volume for these figures is area of the base time the height if we orient them this way—see below.

5. Now rotate each 90° as shown in the figure below:

What is the shape of the part of the cylinder resting on the table? This question will throw students. Students might say it’s resting on a line or a very narrow rectangle.
What is the shape of the part of the triangular prism resting on the table? If they lay it flat, it is a rectangle.
What is the shape of the part of the rectangular prism resting on the table? If they lay it flat, it is a rectangle.
Will all cuts parallel to the table result in the same planar figure for the cylinder? NO, varying rectangles.
Will all cuts parallel to the table result in the same planar figure for the triangular prism? NO, varying rectangles.
Will all cuts parallel to the table result in the same planar figure for the rectangular prism? Yes, they will all be rectangles
Discuss 1) the volume of the figure remains the same despite orientation. 2) For V = Bh, we want all the plane sections parallel to the base to be the same. 3) Orientation is irrelevant for rectangular prisms since all plane sections parallel to the base are the same no matter the orientation.

Again: remember that you’re not just trying to help students recognize the 2 dimensional plane sections; you’re also helping them understand that one can often orient a three-dimensional object in such a way that opposite sides will be the same and thus one can create equal sections. If this can be done, finding the volume of the object will be the base (the section that’s always the same) times the height.
8.2b Homework: Area of Plane Sections

For each plane-section described below, state the shape of the plane-section and its area. Refer to previous class activities, as needed.

1. Imagine cutting a cube, parallel to the base.
   a. What shape is the plane section?
   b. If you cut a $5 \times 5 \times 5$ inch cube parallel to any face, what will the area of the plane section be?
      \[ A = 25 \text{ sq. in} \]

2. Imagine a right square-based prism with edge lengths $\frac{3}{4} \times \frac{3}{4} \times 4\frac{1}{2}$ inches.
   a. If you make a cut parallel to the square base, what will the plane section be?
   b. What will the area of the plane section described in “a” be?
   c. What will the plane section be if the cut is made parallel to the lateral face?
   d. What will the area of the plane section in “c” be?

3. Imagine cutting a sphere with diameter 10 cm parallel to the table through the center.
   a. What shape will any plane section be?
   b. What will the area of the plane section be?

4. Imagine cutting a cylinder of diameter 12.62 cm and height 8 cm, parallel to the base.
   a. What shape is the plane section and what is its area?
      Circle; area $(6.31)^2 \pi \text{ cm}^2 = 39.8161 \pi \text{ cm}^2$ or approximately $125.02 \text{ cm}^2$
   b. What shape is the plane section if the cut is perpendicular to the base? What do you know about the figure?
      It is a rectangle and it will have a height of 8 cm. Students might also say that the biggest rectangle possible would be 12.62 by 8 cm.

5. Imagine a triangular prism:
   a. What shape is the plane section parallel to the base?
   b. What shape is a plane section perpendicular to the base?
   c. If the area of the plane section in “b” is 6.25 cm$^2$ and the height of the prism 5 cm. What was the length of the cut?

6. Imagine cutting a square based right pyramid parallel to the base.
   a. What shape is the plane section?
   b. If the dimensions of the length and the width of the plane section are $\frac{3}{2}$ in. and $\frac{3}{2}$ in., what is the area of the plane section?
Spiral Review

1. Find the perimeter and area of each figure below:
   a. 
   b. 

2. Ten percent of the population is left-handed. Otto believes left-handed people have an advantage in boxing. If he observes 3 people boxing, describe a simulation that would show the probability one is left-handed.

3. Solve and graph the following inequality: 
   \[ 97 \leq 4(19 - 2x) + 3x \leq 22 \]

4. Solve 
   \[ -17 + 5 \]

5. Angel owes his mom $124. Angel made two payments of $41 to his mom. How much does Angel now owe his mother? 
   \[ -124 + (41 \cdot 2) = -42 \]
8.2c Class Activity: Nets of 3D Objects

Review from 6th grade: A net is a two dimensional figure that can be folded to make a three dimensional object. You can learn about a 3D object by examining its net.

Look at each net below. Determine if the net can be folded into a three-dimensional object for which you could make equal parallel planar cuts (e.g. opposite sides are the same). Remember, you can orient objects any way you want. If it does not allow for equal parallel planar cuts, explain why.

<table>
<thead>
<tr>
<th>NET</th>
<th>NET</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image1.png" alt="Net 1" /></td>
<td><img src="image2.png" alt="Net 2" /></td>
</tr>
<tr>
<td>1. Can you create equal parallel plane sections? Yes. Square base. All faces are squares, so this can be turned any direction.</td>
<td>2. Can you create equal parallel plane sections? Yes. Circular base. This object must be oriented with circles as the base.</td>
</tr>
<tr>
<td><img src="image3.png" alt="Net 3" /></td>
<td><img src="image4.png" alt="Net 4" /></td>
</tr>
<tr>
<td>3. Can you create equal parallel plane sections? Yes. This prism must be oriented with the triangle as the base. This one is challenging.</td>
<td>4. Can you create equal parallel plane sections? No matter how the object is oriented, there is no way to make parallel cuts that result in plane sections that are the same.</td>
</tr>
<tr>

<tr>
<td>5. Can you create equal parallel plane sections? Yes, any face can serve as the base.</td>
<td>6. Can you create equal parallel plane sections? Yes, any face can serve as the base.</td>
</tr>
</tbody>
</table>

Right rectangular prisms are first introduced/explored in 5th Grade (5.MD.C.5). Students find volume in 6th Grade (6.GA.2).
7. Can you create equal parallel plane sections?  
No. No matter how the object is oriented, there is no way to make parallel cuts that result in plane sections that are the same.

8. Can you create equal parallel plane sections? Yes. The base must be the pentagon so that all the parallel plane sections are the same size and shape.

Notes: You may want to enlarge the nets and allow students to put them together as solids.

9. Can you create equal parallel plane sections?  
Yes. The base must be the triangle so that all the parallel plane sections are the same size and shape.

10. The net to the right forms a cube.

   a. If each square face of the cube has a side length of 4.2 cm, what is the surface area of the cube? 105.84 cm²
   b. If each square face of the cube has a length of 4.2 cm, what is the volume of the cube? 74.088 cm³

   You might talk with students about why the numeric value for surface area is larger than the numeric value for volume. A good way to do this is to build and discuss a 3×3×3 cube.

c. If you created a new cube with edge lengths that are 150% of the original cube (edge lengths of 4.2 cm), what would the new surface area and volume be? \( SA = 238.14 \text{ cm}^2 \); \( V = 250.047 \text{ cm}^3 \)

   There are two ways students might think about this: Method 1: 1.5(4.2 cm) = 6.3 cm; so the new surface area is \( 6(6.3 \text{ cm})^2 = 238.14\text{cm}^2 \) and the new volume is \( (6.3 \text{ cm})^3 = 250.047\text{cm}^3 \). Method 2: new area is old area multiplied by scale factor squared: 105.84(1.5)² = 238.17 and new volume is old volume multiplied by scale factor cubed: 74.088(1.5)³ = 250.047cm³.

d. If you created a new cube with edge lengths that are 70% of the original cube (edge lengths of 4.2 cm), what would the new surface area and volume be? \( SA = 0.7^2(105.84 \text{ cm}^2) = 51.861\text{cm}^2; \)

   \( V = 0.7^3(74.088 \text{ cm}^3) = 25.4122 \text{cm}^3 \).
8.2c Homework: Nets of 3D Objects

1. Which of the following nets make a cube?

   a. 
   b. 
   c. 
   d. 
   e. 
   f. 

2. Draw a net for the square-based rectangular prism to the right:

3. Suppose the prism in # 2 above has base edges of $8 \times 8 \times 12$ inches. Find the surface area and volume of the prism. Show all your work.

4. Still using the prism above, find the new dimensions of the prism if you scaled it by 3/2. Then find the new surface area and volume.
   
   New dimensions: $8(3/2)=12$, $12(3/2)= 18$, $12 \times 12 \times 18$ inches
   New SA = $512(3/2)^2 \text{ in}^2 = 1,152 \text{ in}^2$
   New V = $768(3/2)^3 \text{ in}^3 = 2,592 \text{ in}^3$

5. Still using the prism above, find the new dimensions of the prism if you scale it by 2/3. Then find the new surface area and volume.
Spiral Review

1. Solve:
   a. 3 9 –6
   b. 47 + (–65) –18

2. On a map of New York City, with a scale of 1 inch = ½ mile, Central Park is 1 inch wide and 5 inches long. What is the area of the park? 0.5 mi × 2.5 mi = 1.25 mi²

3. Find the surface area and volume of the following rectangular prism: SA = 210 m²; V = 196 m³

4. Find the additive inverse and multiplicative inverse of each of the following numbers:

<table>
<thead>
<tr>
<th>Number</th>

8.2c Additional Practice: Surface Area and Volume

1. Explain your procedure for finding surface area.

2. Explain your procedure for finding volume.

3. Find the surface area and volume of the right prism below. Note that the triangular bases are right triangles with the right angle occurring where the 4m and 3m sides meet.

\[
\text{SA} = 81.96 \text{ m}^2 \\
V = 0.5(4)(3)(5.83) \text{ m}^3 = 34.98 \text{ m}^3
\]

Find the surface areas and volume for each. You may wish to sketch the figure. Show work. Include units.

<table>
<thead>
<tr>
<th>Shape and Dimensions</th>
<th>Surface Area</th>
<th>Volume</th>
</tr>
</thead>
</table>
| 4. Rectangular prism:  
  • length 10 in  
  • width 8 in  
  • height 5 in. | SA = 340 in\(^2\) | V = 400 in\(^3\) |
| 5. Rectangular prism:  
  • length 4 feet  
  • width 2 feet  
  • height 6.2 feet | SA = 90.4 ft\(^2\) | V = 49.6 ft\(^3\) |

6. If the base area of a right rectangular prism is 28 cm\(^2\) and the volume is 177.8 cm\(^3\), what is the height of the prism? 6.35cm

7. If the height of a square based prism is 13 in and its volume is 637 in\(^3\), what is the length of each side of the base? The square is 7 in \(\times\) 7 in

8. Give three possible edge lengths for a prism of volume 96 m\(^3\). Answers will vary. The product of the three lengths must be 96. Encourage students to come up with non-whole number values.
8.2d Class Activity: Growing and Shrinking Stuff

For each of the following problems, find the necessary measurements to answer all the questions.

1. A cube with side lengths of 8 centimeters is enlarged so its side lengths are now 24 centimeters.
   a. By what scale factor did the side lengths increase? Show your work or justify your answer.
      3 times
   b. By what scale factor will the surface area increase? Show your work or justify your answer.
      9 times
   c. By what scale factor did the volume increase? Show your work or justify your answer.
      27 times

2. A rectangular prism with side lengths of 5 yards, 10 yards, and 15 yards is reduced by a scale factor resulting in new sides of 1 yd, 2 yd, and 3 yd.
   a. What was the scale factor for the reduction? 1/5
   b. What would be the new surface area and volume for the prism? SA = 2(1)(2) + 2(2)(3) + 2(1)(3) = 22 yd². V = 1(2)(3) = 6 yd³
   c. By what scale factor did the surface area and volume each change? SA changed by 1/25 and V by 1/125.

3. A rectangular prism with side lengths 2 mm, 3 mm, and 5 mm is enlarged by some scale factor. The new volume of the prism is 240 mm³.
   a. By what scale factor were the side lengths increased?
      Scale factor of 2. Notice 2 × 3 × 5 × x³ = 240; 30x³ = 240; x³ = 8. So students are looking for a number that they can cube to get 8. With number sense, they should reason that the scale factor was 2.
   b. What is the new length of each of the sides? 4 mm, 6 mm, 10 mm.
   c. What is the new surface area of the prism? 2(4)(6) + 2(6)(10) + 2(4)(10) = 248 mm²
8.2d Homework: Growing and Shrinking Stuff

For each of the following problems, find the necessary measurements to answer all the questions.

1. A mini cereal box has the following dimensions: 4.5 in by 6 in by 2 in.
   a. If all the dimensions are doubled, will it require double the amount of cardboard to make the box? Why or why not?
   b. If all the dimensions are doubled, will it hold double the amount of cereal? Why or why not?
   c. If one of the dimensions is doubled, will it require double the amount of cardboard to make the box? Why or why not?
      No, the original surface area is \(2(4.5)(6) + 2(6)(2) + 2(4.5)(2) = 96 \text{ in}^2\). If we double just one side we get:
      \(2(9)(6) + 2(6)(2) + 2(9)(2) = 170 \text{ in}^2\) or
      \(2(4.5)(12) + 2(12)(2) + 2(4.5)(2) = 174 \text{ in}^2\) or
      \(2(4.5)(6) + 2(6)(4) + 2(4.5)(4) = 138 \text{ in}^2\)
      In other words, the surface area changes depending on which length is doubled. Notice that the new box for any doubled side length is not a scaled version of the original.
   d. If one of the dimensions is doubled, will it hold double the amount of cereal? Why or why not?

2. A container of chocolate milk mix has the following dimensions: a square base with sides of 6 in. and height 9 in.
   a. If all the dimensions are reduced by a scale factor of \(\frac{1}{3}\), will it require a third the amount of materials to make the container? Why or why not?
      No, we need \(\frac{1}{9}\) times as much material e.g. \((1/3)(1/3)\)
   b. If all the dimensions are reduced by a scale factor of \(\frac{1}{3}\), will it hold a third the amount of chocolate milk mix? Why or why not?
   c. If the length of each side of the base is reduced by a scale factor of \(\frac{1}{3}\), how much surface area and volume will it now have?
      \(\text{SA} = 2(2)(2) + 4(2)(9) = 80 \text{ in}^2\)
      \(V = 2 \times 2 \times 9 = 36 \text{ in}^3\)
   d. What is the percent change of surface area and volume for “c”?
3. Refer back to the mini cereal box with dimensions, 4.5” by 6” by 2”.
   a. If all the dimensions are increased by 4 inches to: 8.5” by 10” by 6” how does this change the amount of cardboard needed to make the box?
      Originally, the surface area was $2(4.5)(6) + 2(6)(2) + 2(4.5)(2) = 96$ in$^2$. Now the SA is $2(8.5)(10) + 2(10)(6) + 2(8.5)(6) = 392$ in$^2$
      So, $(392 - 96)/96 \approx 3.0833 = 308.33\%$ increase.

   b. If all the dimensions are increased by a value of 4 inches, as described above, how will this change the amount of cereal the box can hold?

   Spiral Review

1. Mrs. Zamora will not tell you how the class in general did on the last test. You really want to know how you compare, so you survey 10 random students out of 35. Estimate the average score for your class and describe how far off the estimate might be.

2. Draw and describe the plane section that results from the following cut: a cylinder cut parallel to the base.

3. Katherine is visiting patients in a hospital. She visits 9 patients in 3 hours. She visits 18 patients in 6 hours. Is this situation proportional? If so, what is the unit rate? Yes. She visits 3 patients per hour.

4. A candidate for Congress is trying to decide what to focus her campaign on in order to win the election. Describe how she might obtain a random sample to know what issues are important to her constituents. Answers will vary. She may obtain a list of registered voters and use a computer to select a random sample.

5. Kurt puts 70% of his earnings into his savings. Write and solve an equation to find how much money he earned if he had $165 to spend.
   
   $x(1 - 0.7) = 165$
   
   $0.3x = 165$ He earned $550.
   
   $x = 550$
8.2e Project: Packing Packages

Have you ever notice that cereal generally comes in tall thin boxes and that laundry soap generally comes in short wide boxes? Why do you think they come as they do?

Think about your experiences with perimeter, surface area, and with volume in this chapter. What kind of box do you predict might hold the most and take the least amount of cardboard? Explain your thinking.

Suppose your favorite cereal comes in a box that is 24 cm. high, 20 cm. long, and 6 cm. wide. This box of cereal costs $4.35.

1. Draw a model of the box. Find the surface area and volume for the box. Show work and label answers

\[ SA = 1488 \text{ cm}^2 \]
\[ V = 2880 \text{ cm}^3 \]

The 24 cm \times 20 cm \times 6 cm dimensions of the box can also be thought of as a height of 24 cm and a girth (distance around the box) of 52 cm. If we add these two measures (height and girth), we get 76 cm.

For this project you will:

a. Draw a model of a box with a total girth plus height of no more than 76 cm that holds the most cereal possible with the least surface area possible.

b. Build the box as described in “a”.

c. Provide a table, graph or spreadsheet to show how you arrived at your dimensions (remember: use only height and girth for your table, graph, or spreadsheet.)

d. Find the percent decrease in surface area for your new box from the original box.

e. Find the percent increase in volume for your new box from the original box.

f. Write two paragraphs about your project. In the first paragraph, state and justify how much you would charge for cereal in this box. In the second paragraph, explain why you think cereal does not come in the type of box you designed.
**8.2f Self-Assessment: Section 8.2**

Consider the following skills/concepts. Rate your comfort level with each skill/concept by checking the box that best describes your progress in mastering each skill/concept. Sample problems can be found on the following page.

Sample Problems for Section 8.2

1. Draw and describe the plane section that results from the following cuts.
   a. A right rectangular prism is cut parallel to the base.
   b. A cube is cut perpendicular to the base and parallel to a face.
   c. A right pyramid is cut parallel to the base.
   d. Describe how each cut above is similar and different from other similar cuts for the same object.

2. Answer each question about volume and surface area.
   a. Find the volume and surface area of the triangular prism below.
   b. Find the volume and surface area of a right rectangular prism with dimensions 8 cm by 15 cm by 2 cm.
   c. If a right rectangular prism with dimensions 8 cm by 15 cm by 2 cm is scaled by a factor of 3, what would the new volume and surface area be?
   d. What is the length of a box with a surface area of 472 cm² and a width of 11 cm and a height of 6 cm?
   e. Ellie is filling a sandbox for her son. The sandbox dimensions are 4 ft by 4 ft by 1 ft. How many cubic feet of sand does she need to buy to fill the sandbox?

3. The dimensions of Hans’ turtle aquarium are 18 in by 18 in by 12 in. The dimensions of Anna’s rabbit cage are all doubled.
   a. Find the surface area and volume of each animal habitat.
   b. Find the scale factor between the surface areas of each container.
   c. Find the scale factor between the volumes of each container.
   d. In general, how are the scale factors of surface areas related? Volumes related?
Play Dough Recipe

Ingredients:
- 2 C flour
- 2 C warm water (food coloring is optional)
- 1 C salt
- 2 T oil
- 1 T cream of tartar

Directions:
In a medium pot, add water and oil together and stir. Then add the flour, salt, and cream of tartar. Keep stirring until all the ingredients are blended together and the mixture is not sticking to the sides of the pot. Then knead the mixture. For storage, keep play dough in plastic bags or sealed containers.
